12 **Key words:** SARS-CoV-2; COVID-19; hydroxychloroquine; azithromycin

13 We thank the authors for the comments provided for our article (1-3), but we would like to
14 clarify key points for the story of this manuscript (4) that are critical in the context of COVID-
15 19 outbreak and for the perspective of this work. When COVID-19 starts around the world the
16 Editor-In-Chief of the Journal International Journal of Antimicrobial Agents (JM. Rolain)
17 asked colleagues (D. Raoult, PR. Hsueh, and S. Stefani) to launch a special issue in the
18 journal to create a real-time rapid debate around this emerging disease with special regards to
19 therapeutic options (5). Our preliminary paper (4) in this way was relatively trivial i.e
20 reported, in an emergency situation, a comparative analysis between a small group treated
21 with hydroxychloroquine and another small group not treated with hydroxychloroquine
22 showing a significant decrease of viral shedding after 6 days of therapy.

23 Surprisingly, despite the very small size of the group, the addition of azithromycin
24 made a difference on the endpoint we chose, which is the disappearance of the viral load in
25 the pharynx that is the only data that can be analyzed on a small group. Indeed, neither
26 mortality, nor the passage in intensive care unit, nor the duration of the treatment can be
27 evaluated on such a small group. This preliminary information was essential in our opinion
28 especially as it confirmed the preliminary *in vitro* and *in vivo* results against SARS-CoV-2
29 announced by the Chinese (6-8), also confirming previous *in vitro* reports on the anti-SARS-
30 CoV-1 coronavirus activity dating back to 2004 (9-12). This preliminary report paved the way
31 for work testing its reproducibility.

32 On the therapeutic level, the hydroxychloroquine + azithromycin combination was
33 found to be the most effective (4) consistent with *in vitro* synergistic antiviral activity
34 reported in our laboratory (13). Azithromycin had already, contrary to what one of the authors
35 says, been tested effectively on Zika (14,15), so we knew that it had an antiviral action. With
36 regard to our seminal paper on *in vivo* anti-SARS-CoV-2 activity of hydroxychloroquine (4),
37 we were subjected to unprecedented violence. I (DR) was asked to confess that I had a

38 relationship and a conflict of interest with Sanofi, which is laughable when you use generics
39 and you have had no relationship with the pharmaceutical industry at all at IHU (our center)
40 for 5 years. At the same time, the authors who published on remdesivir, for those we know,
41 the French, did not declare any conflict of interest in the New England Journal of Medicine
42 (16). In fact, it was much more credible to look for conflicts of interest relating to Gilead than
43 to Sanofi (17). The second thing is that I (DR) was harassed to give all the evidence to show
44 that this was done after the agreement of our government, the evaluation by the Committee
45 for the Protection of Individuals, and that it was done in all regularity (validated by ANSM,
46 the French FDA, available online in the EU Clinical Trial Register Page, EudraCT number:
47 2020-000890-25). Subsequently, we were threatened for retraction of this article, with no
48 justification other than the opinion of people who were fiercely hostile to the use of
49 hydroxychloroquine. It should be noted that this paper is now by far the most cited paper in
50 the literature on the treatment of COVID-19, exceeding 1600 citations in Google Scholar.

51 As a result of this paper, half of the world's population now benefits from a
52 recommendation of hydroxychloroquine with or without azithromycin, this currently concerns
53 more than 4.5 billion people (18). On the other hand, methodological problems and problems
54 of scientific misconduct with non-declaration of conflict of interest have multiplied for
55 therapeutics including remdesivir in the best journals, including those of Elsevier, which
56 ended up with the retraction of a paper that had probably been completely invented (19).

57 Finally, we have recently carried out a meta-analysis of all the work done on
58 hydroxychloroquine (20) that is upgraded in this response. Here, we specifically focused on
59 mortality and viral shedding persistence, including a new randomized controlled trial
60 reporting a favorable effect on mortality (21) (Figure 1). Importantly, while the conflict has
61 been particularly violent in France and the United States, 5 studies from both these countries
62 has just shown that hydroxychloroquine reduces rate of hospitalization, length of

63 hospitalization, mortality, and viral shedding in 4,642 (22), 3,737 (23), 2,820 (24), 2,541 (25)
64 and 518 (26) patients.

65 This new meta-analysis (Figure 1) included 18,211 patients (10,409 treated by a
66 chloroquine derivative) from 12 studies and assessed mortality in 4 countries (China (27),
67 France (22,23,28-30), Spain (31), and USA (24-26,32,33). A two-fold decrease of the risk of
68 death was confirmed in clinical studies (number of comparisons (n) = 8, odds ratio 0.53, 95%
69 confidence interval (95%CI) 0.40 – 0.71, p = .00003) but not among big data studies (n = 6,
70 OR = 0.92, 95%CI 0.76 - 1.10, p = .36 – Figure 1A). Heterogeneity was significant between
71 clinical and big data studies (Q-value 9.45, p = .002). Effect size was consistent among
72 clinical studies ($I^2 = 31\%$, p = 0.18) but not among big data studies ($I^2 = 69\%$, p = .006).
73 Indeed, a new big data study (24) recently reported a very significant two-fold decrease in
74 mortality in 2,820 patients from the 8 hospitals of the Mount Sinai Health System (New York,
75 USA). This result contrasted with other big data studies (22,32,33). Despite substantial
76 heterogeneity, a significant summary effect was observed when including all comparisons
77 from all included studies (n = 14, OR 0.79, 95%CI 0.67 - 0.92, p = .003). Exclusion of the
78 study from our center (23) did not modify the overall effect (n = 13, OR = 0.82, 95%CI 0.70 –
79 0.97, p = .023) nor the two-fold decrease in the risk of death among the 7 clinical studies from
80 other centers (n = 7, OR 0.48, 95%CI 0.32-0.72, p = .0004).

81 Regarding persistent viral shedding, a total of 4,540 patients (3,544 treated by a
82 chloroquine derivative) from 8 studies from only 4 countries were included (5 from China
83 (21,34-37)), 1 from France (23), 1 from Saudi Arabia (38) and 1 from South Korea (39)) with
84 a significant two-fold decrease of the risk of viral persistence (11 comparisons, OR 0.47,
85 95%CI 0.28 – 0.79, p = .005, Figure 1B). Exclusion of our study (23) did not change the
86 effect size (n = 10, OR = 0.45, 95%CI 0.23 – 0.88, p = .02). Strikingly, none of the big data
87 studies and none of the studies from USA assessed the virus persistence.

88 This new meta-analysis shows that, apart from the unverifiable work that did not
89 assess virological outcome and carried out by people who had conflicts of interest with Gilead
90 (17), the body of publications shows that hydroxychloroquine therapy is significantly and
91 reproducibly correlated with a two-fold decrease in both mortality and viral shedding.

92 In practice, our seminal work (4) has benefited from a massive diffusion despite a
93 profusion of papers that have not been verified but accepted each time they had a negative
94 position towards hydroxychloroquine (40). However, the facts being stubborn, the
95 accumulation of publications showing that hydroxychloroquine is effective following our
96 paper, or at the same time by Chinese authors, leaves no doubt that this preliminary study did
97 indeed paved the way for a therapeutic strategy that is now being generalized throughout the
98 world, and whose favorable results have been replicated several times.

A. Mortality

B. Persistent viral shedding

247

248 Figure 1. Meta-analysis on chloroquine derivatives for COVID-19

249 CI: confidence interval, HCQ: hydroxychloroquine, CQ: Chloroquine, RCT: randomized
 250 controlled trial, (H)CQ: chloroquine derivatives (hydroxychloroquine (HCQ) or chloroquine
 251 (CQ)). This meta-analysis was performed with a random-effects model using Comprehensive
 252 Meta-Analysis v3 (Biostat, Englewood, NJ, USA).
