

Supplementary Figure 5. Chemically stabilized HBV siRNA do not induce local interferon-beta production in the liver. Interferon- β levels in **(a)** blood plasma and **(b)** Liver homogenates of mice 6h after intravenous administration of SNALP formulated HBV263R, HBV263invR (unmodified), HBV263M and HBV263invM (chemically stabilized) siRNA. SNALP were administered at 5 mg/kg siRNA. Livers were homogenized in PBS at 1 mg tissue/ml. Values represent mean + SD; n = 4 mice.
