

Table S1. Estimates of carbon stocks for tropical landscapes. All values include carbon stored in aboveground and belowground living plant biomass (t C / ha)^{1, 2}

| Biomass Carbon of Tropical Land Cover Types (t C / ha) | | | | | | | | | | | | |
|--|----------|----------|-----|--------------------|----------|-----|-----------------------------|----------|-----|--------------|----------|-----|
| Crop Type | Americas | | | Sub-Saharan Africa | | | Southeast Asia ² | | | Pan-Tropical | | |
| | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry |
| Forests | 197 | 132 | 130 | 204 | 156 | 76 | 229 | 109 | 82 | 210 | 132 | 96 |
| Disturbed Forests ³ | 100 | 68 | 67 | 104 | 80 | 40 | 116 | 56 | 43 | 107 | 68 | 50 |
| Shrubland / Savanna | 64 | 43 | 42 | 67 | 51 | 24 | 75 | 35 | 26 | 69 | 43 | 31 |
| Grassland | 8 | 8 | 4 | 8 | 8 | 4 | 8 | 8 | 4 | 8 | 8 | 4 |
| Degraded Land ⁴ | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Annual Cropland ⁵ | 6 | 7 | 7 | 4 | 3 | 5 | 5 | 5 | 5 | 5 | 5 | 5 |
| Sugarcane ⁵ | 11 | 14 | 15 | 5 | 9 | 14 | 13 | 13 | 14 | 10 | 12 | 14 |
| Oil Palm ¹ | 71 | 79 | 72 | 17 | 23 | 45 | 88 | 77 | 77 | 58 | 60 | 65 |
| Coconut ³ | 95 | 93 | 93 | 68 | 41 | 29 | 67 | 66 | 74 | 77 | 66 | 65 |

- Humid, seasonal and dry ecoregions were defined according to the FAO Global Ecoflorisitic zones. The dry ecoregions includes both dry tropical forests and shrublands. Mountain ecoregions were included as humid tropics in Southeast Asia and dry tropics in Africa and Latin America. All biomass carbon values estimated using IPCC Tier-1 methods (Eggelston *et al* 2006, Gibbs *et al* 2007). Estimates include litter and dead wood carbon stocks for forests (Eggelston *et al* 2006).
- Used insular Southeast Asia value for humid forests and continental Southeast Asia values for seasonal and dry forests based on patterns of forest distribution.
- Forest carbon values were reduced by 50% to estimate disturbed forest biomass (i.e. affected by shifting cultivation, logging, fragmentation, fire etc.)
- Assumed that degraded lands have very little living biomass.
- To estimate biomass for annual crops, we assigned 5 t C / ha to the mean tropical yield for annual crops and then scaled according to regional yields. Ratios of average pan-tropical yield / regional yields (0.85, 0.73, 0.76 for Americas, 1.41, 1.45, 1.11 for Africa, and 1.01, 0.99, 1.10 for Asia).

6. Assumed sugarcane stored 14 t C / ha in seasonal Americas. Scaled across the tropics using ratios of Africa and Southeast Asia / seasonal Americas yield data (0.82 and 1.07 for humid and dry Americas and 0.33, 0.67 and 0.97 for humid, seasonal and dry Africa, and 0.95, 0.93, and 0.98 for humid, seasonal and dry Southeast Asia, respectively)
7. Oil palm value based on average IPCC GPG (Eggelston *et al* 2006) value for humid Southeast Asia, we used 0.47 for C fraction and then added in root biomass according to IPCC. Scaled across tropics using ratios of Africa and Americas / humid Southeast Asia yield data (0.81, 0.91, 0.82 for humid, seasonal and dry Americas and 0.19, 0.26 and 0.51 for humid, seasonal and dry Africa, and 0.87 and 0.88 for seasonal and dry Southeast Asia, respectively).
8. Coconut value based on best guess for humid Southeast Asia, we used 0.47 for C fraction and then added in root biomass according to IPCC (Eggelston *et al* 2006). Scaled using ratios of Africa and Americas / humid Southeast Asia yield data (1.41, 1.37, 1.38 for humid, seasonal and dry Americas and 1.0, 0.61 and 0.44 for humid, seasonal and dry Africa, and 0.98 and 1.10 for seasonal and dry Southeast Asia, respectively).

Table S2. Estimates of organic soil carbon stocks for tropical landscapes. Values down to 1m depth (t C / ha)^{1,2}

| Organic soil carbon stocks for tropical land sources (t C / ha) | | | | | | | | | | | | |
|---|----------|----------|-----|--------------------|----------|-----|----------------|----------|-----|--------------|----------|-----|
| Crop Type | Americas | | | Sub-Saharan Africa | | | Southeast Asia | | | Pan-tropical | | |
| | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry |
| Forest / Disturbed Forest | 77 | 76 | 67 | 77 | 67 | 60 | 62 | 73 | 73 | 72 | 72 | 67 |
| Shrubland / Savanna / Grassland | 45 | 45 | 45 | 41 | 41 | 41 | 80 | 80 | 80 | 55 | 59 | 59 |

1. Average soil carbon stock estimates for each FAO ecoregions and continent derived from Batjes (2006). Values over 500 t C / ha were excluded from Southeast Asia to estimate non-peat carbon stocks.
2. Conversion of natural ecosystems to cropland emits 25% of soil carbon while conversion to plantations emits 10% (Murty *et al* 2002, Guo and Gifford 2002, Houghton and Goodale 2004). Peat soils, not included in the table, are assumed to emit ~1600 t C / ha over 120 year period (Hooijer *et al* 2006, Page *et al* 2002).

Table S3. Conversion factors used to convert estimates of crop yields into potential volume of biodiesel or ethanol.¹

| Biofuels Conversion Factors | |
|------------------------------------|-------------------|
| Biodiesel Crops | liters/ton |
| Oil Palm | 223 |
| Soybean | 183 |
| Coconut | 130 |
| Groundnut | 309 |
| Castor | 393 |
| Ethanol Crops | liters/ton |
| Corn | 410 |
| Sugarcane | 81 |
| Wheat | 389 |
| Cassava | 180 |
| Rice | 430 |

¹ Biodiesel crop yields were first converted to oils using the average oil content of the different oilseed crops, and then converted to liters by dividing by the crop oil densities. Volumes of raw vegetable oils were reduced by a processing ratio of 0.96 to account for losses in converting to food-grade vegetable oil and then by a biodiesel refining ratio of 0.98 to account for the conversion efficiency of processed vegetable oil to refined biodiesel (NREL 2004). The processing of ethanol, which can come from grains, sugars and starches, is more crop specific than biodiesel. As such, pre-calculated conversion factors (in liters/tons) were compiled from a variety of sources (e.g., Shapouri and Salassi 2004, Nigam and Agrawal 2004).

Table S4. Mean potential biofuel yields across the tropics and world circa 2000 (L / ha)¹

| Biofuel Crop Yields (Liters / ha) | | | | | | | | | | | | | |
|-----------------------------------|---------|----------|-------|--------|----------|-------|-------|----------|-------|--------------|----------|-------|---------------|
| Crop Type | America | | | Africa | | | Asia | | | Pan-Tropical | | | Global 90th % |
| | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry | Humid | Seasonal | Dry | |
| Maize | 836 | 1,167 | 865 | 469 | 500 | 563 | 936 | 930 | 750 | 770 | 912 | 707 | 3,729 |
| Sugarcane | 4,531 | 5,529 | 5,892 | 1,846 | 3,683 | 5,372 | 5,240 | 5,138 | 5,408 | 4,644 | 5,390 | 5,510 | 7,752 |
| Wheat | 616 | 762 | 807 | 674 | 638 | 662 | 676 | 894 | 1,042 | 657 | 869 | 1,015 | 1,913 |
| Rice | 1,345 | 1,293 | 2,026 | 654 | 727 | 740 | 1,535 | 1,370 | 1,261 | 1,461 | 1,329 | 1,257 | 2,819 |
| Cassava | 2,285 | 2,223 | 1,835 | 1,898 | 1,437 | 1,379 | 2,445 | 1,972 | 3,066 | 1,930 | 1,651 | 2,016 | 2,965 |
| Oil Palm | 3,249 | 3,643 | 3,310 | 757 | 1,062 | 2,044 | 4,013 | 3,511 | 3,530 | 2,882 | 1,690 | 3,225 | 4,507 |
| Castor | 398 | 416 | 202 | 116 | 126 | 237 | 195 | 180 | 401 | 232 | 245 | 367 | 699 |
| Soybean | 490 | 448 | 425 | 149 | 141 | 241 | 221 | 252 | 178 | 369 | 432 | 221 | 554 |
| Coconut | 864 | 839 | 846 | 613 | 370 | 267 | 611 | 598 | 669 | 620 | 602 | 622 | 746 |
| Groundnut | 366 | 516 | 461 | 263 | 281 | 248 | 501 | 420 | 313 | 394 | 319 | 287 | 962 |

¹Area weighted mean crop yields derived from Monfreda *et al* (2008) across different tropical regions and converted to potential ethanol and biodiesel yields using conversion factors in Table S3. We calculated the area-weighted 90th percentile yields for each crop by first sorting all of the global cropland data according to yield and then aggregating the area cultivated until the top 10th percent was reached – this was done to ensure small agricultural plots with lower than normal yields would not skew the results.

Table S5a: Ecosystem Carbon Payback Time (in years) for biofuels produced from different tropical land sources in tropical Latin America.

Note that this table provides more detailed information for each ecoregion and continent combination, rather than averaged across all continents as depicted in Figure 3.
