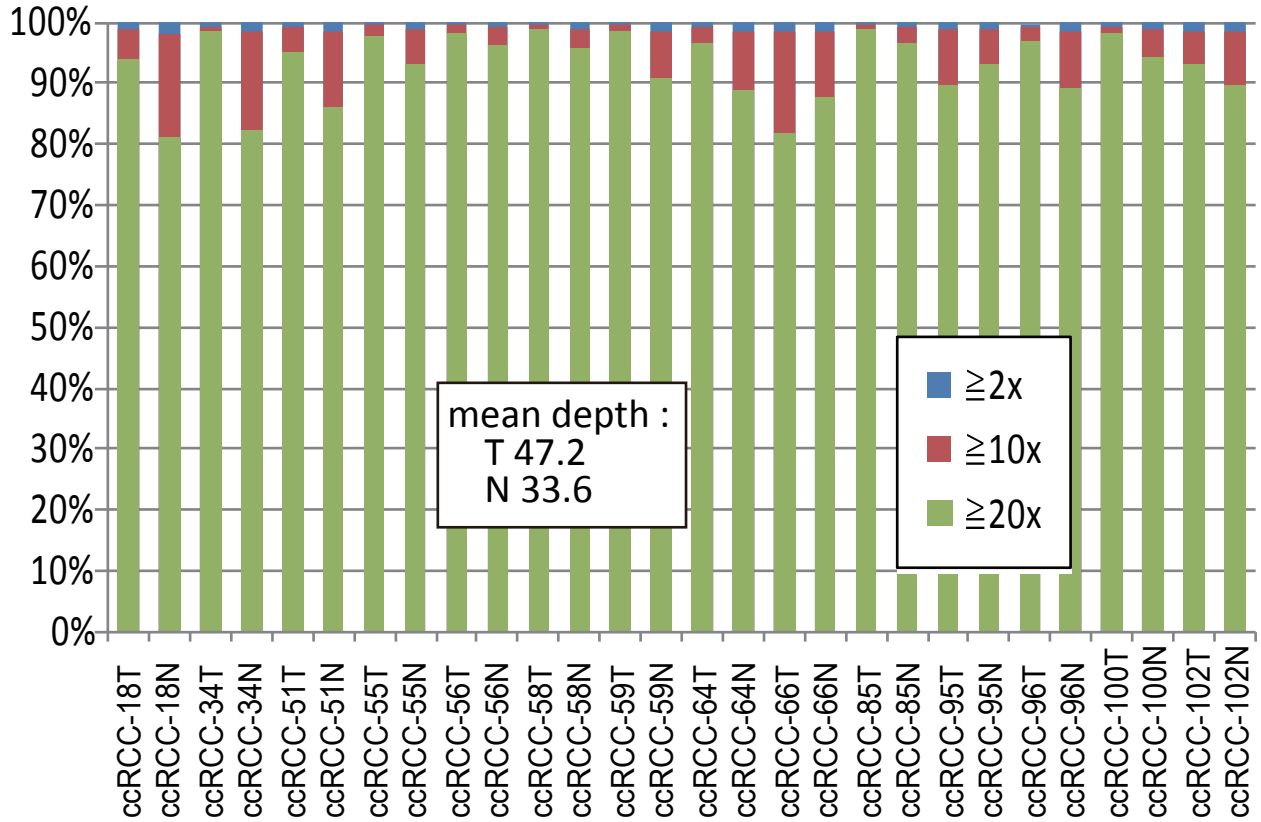
2. Supplementary Tables

3. Supplementary Note**……p.28**

Nature Genetics: doi:10.1038/ng.2699

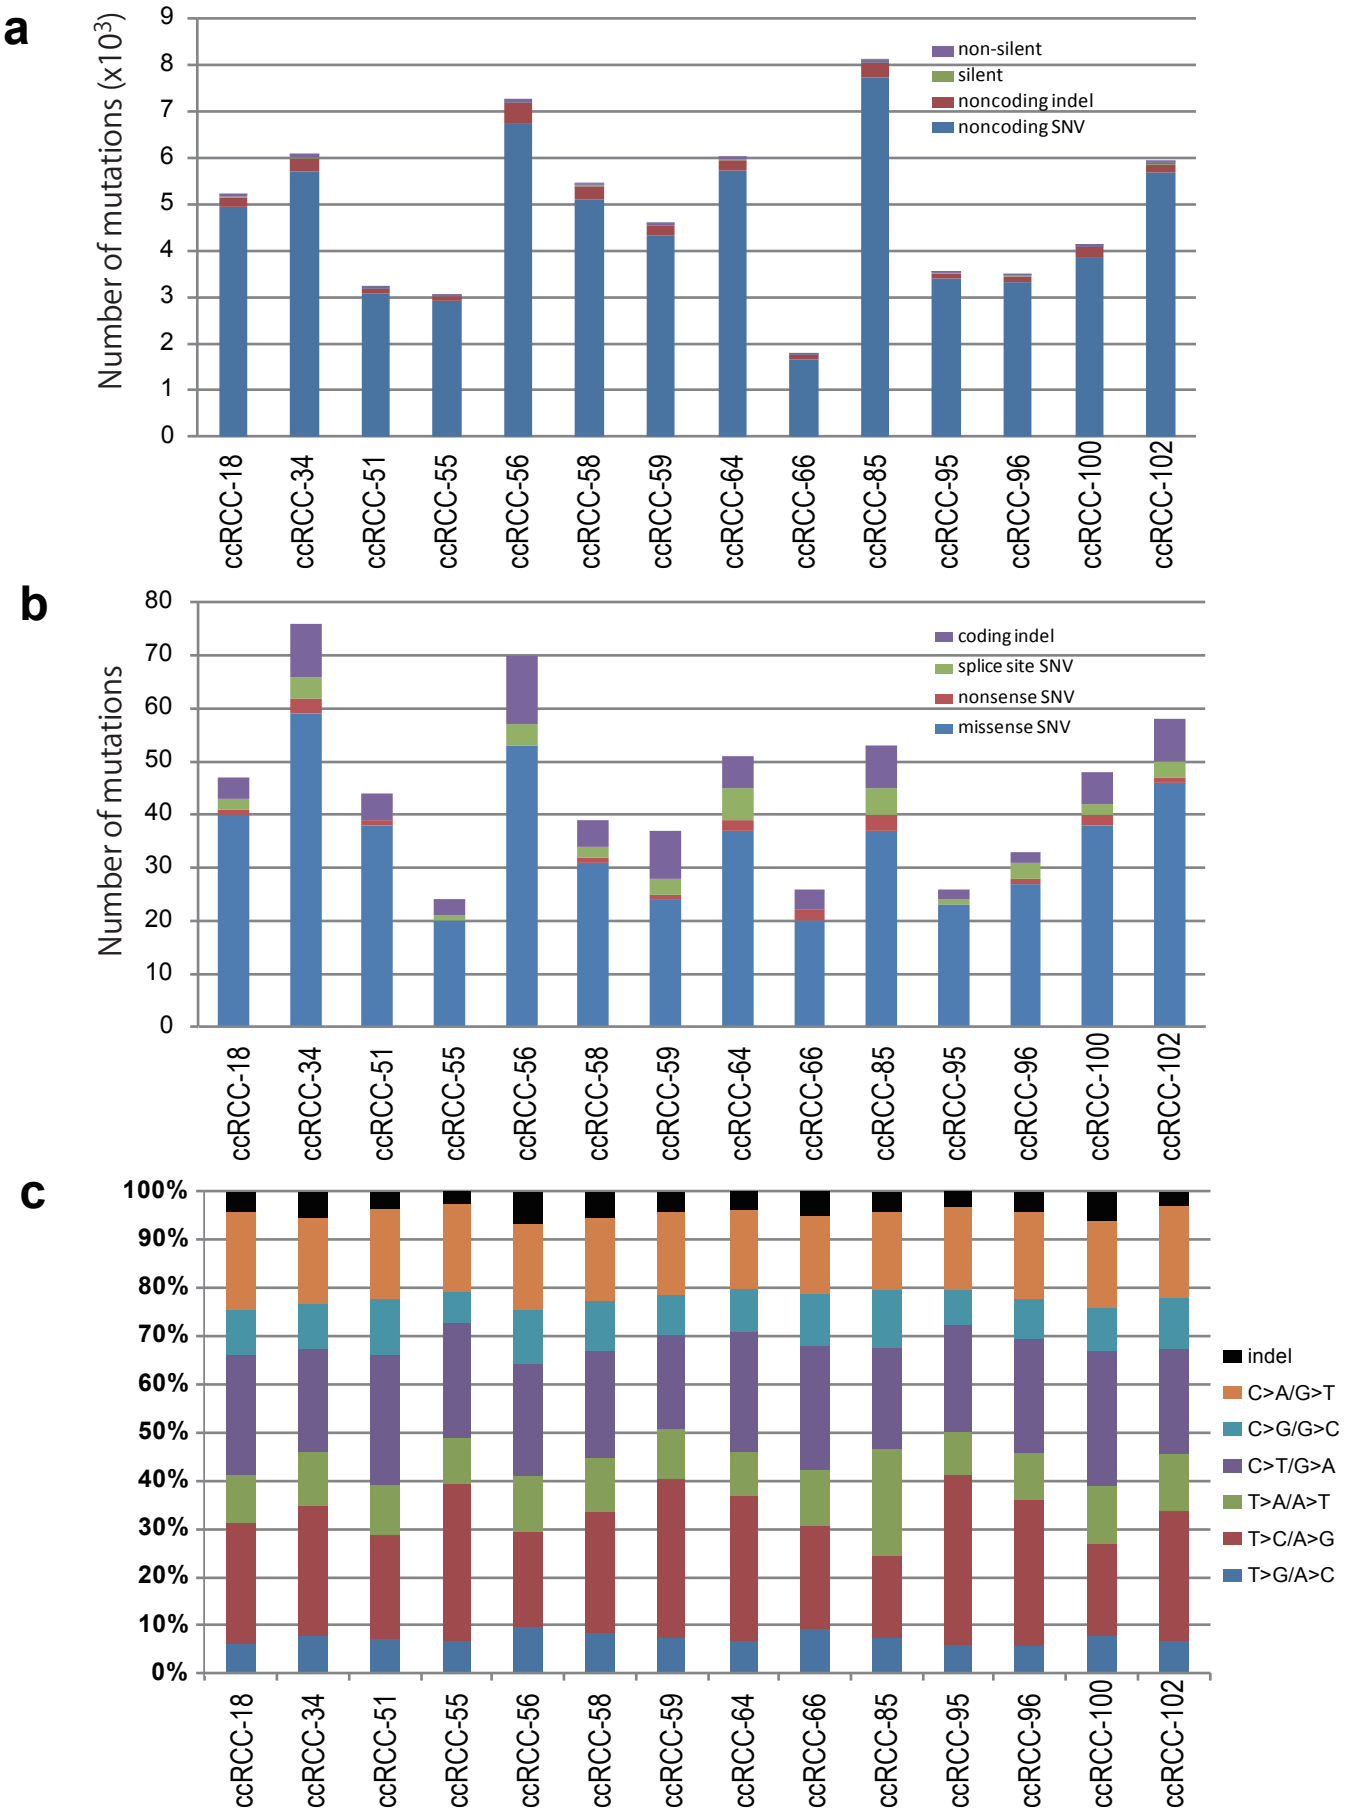
Supplementary Figure 1



Mean coverage by whole-genome sequencing for paired tumor (T)/normal (N) DNA from 14 ccRCC cases.
Genomic fractions analyzed by the indicated coverage are shown by colors.

Nature Genetics: doi:10.1038/ng.2699

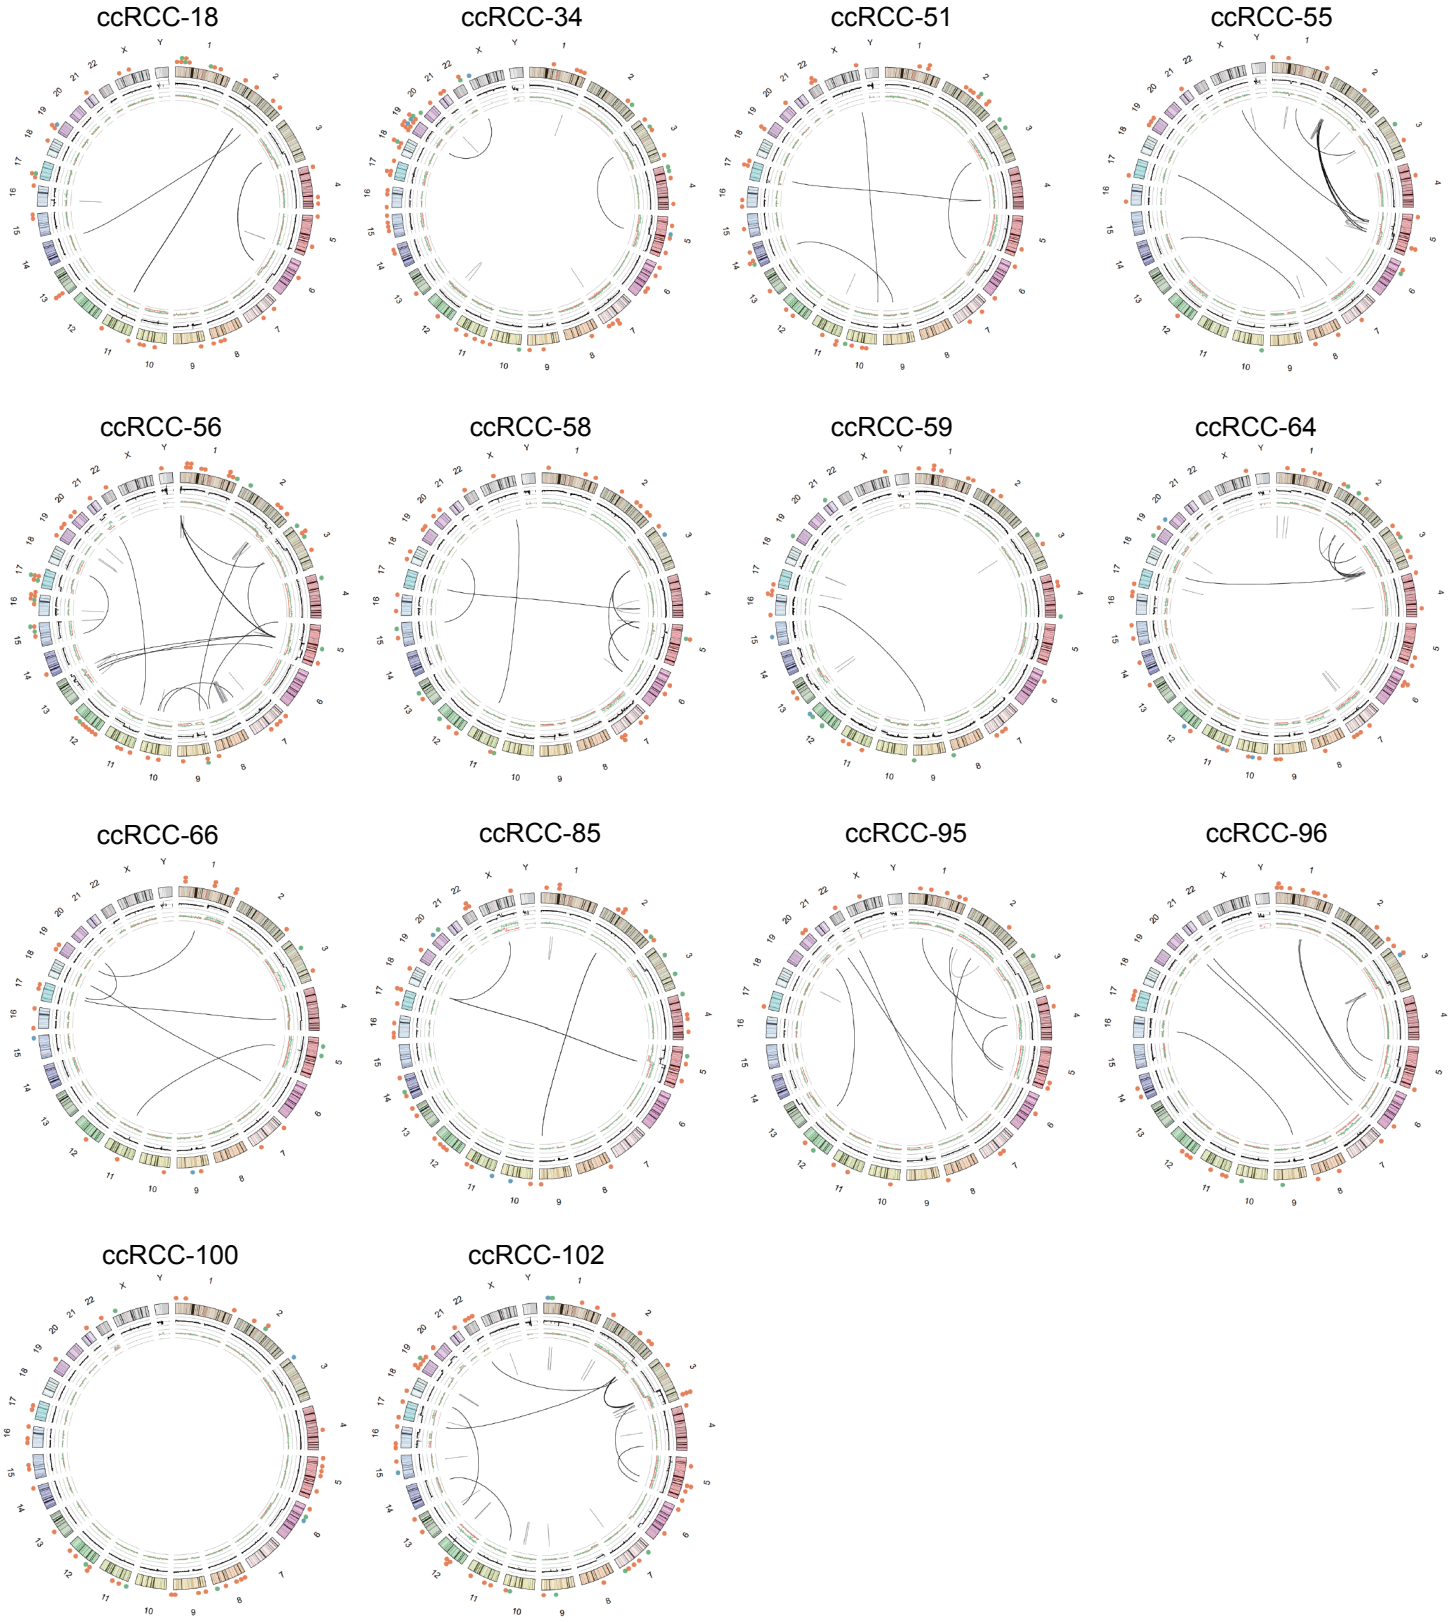
Supplementary Figure 2



Somatic mutations detected by whole-genome sequencing for 14 ccRCC specimens
(**a**) Total number of mutations within coding and non-coding regions. (**b**) Differential counts of non-silent mutations. (**c**) Spectrum of single-nucleotide substitutions.

Nature Genetics: doi:10.1038/ng.2699

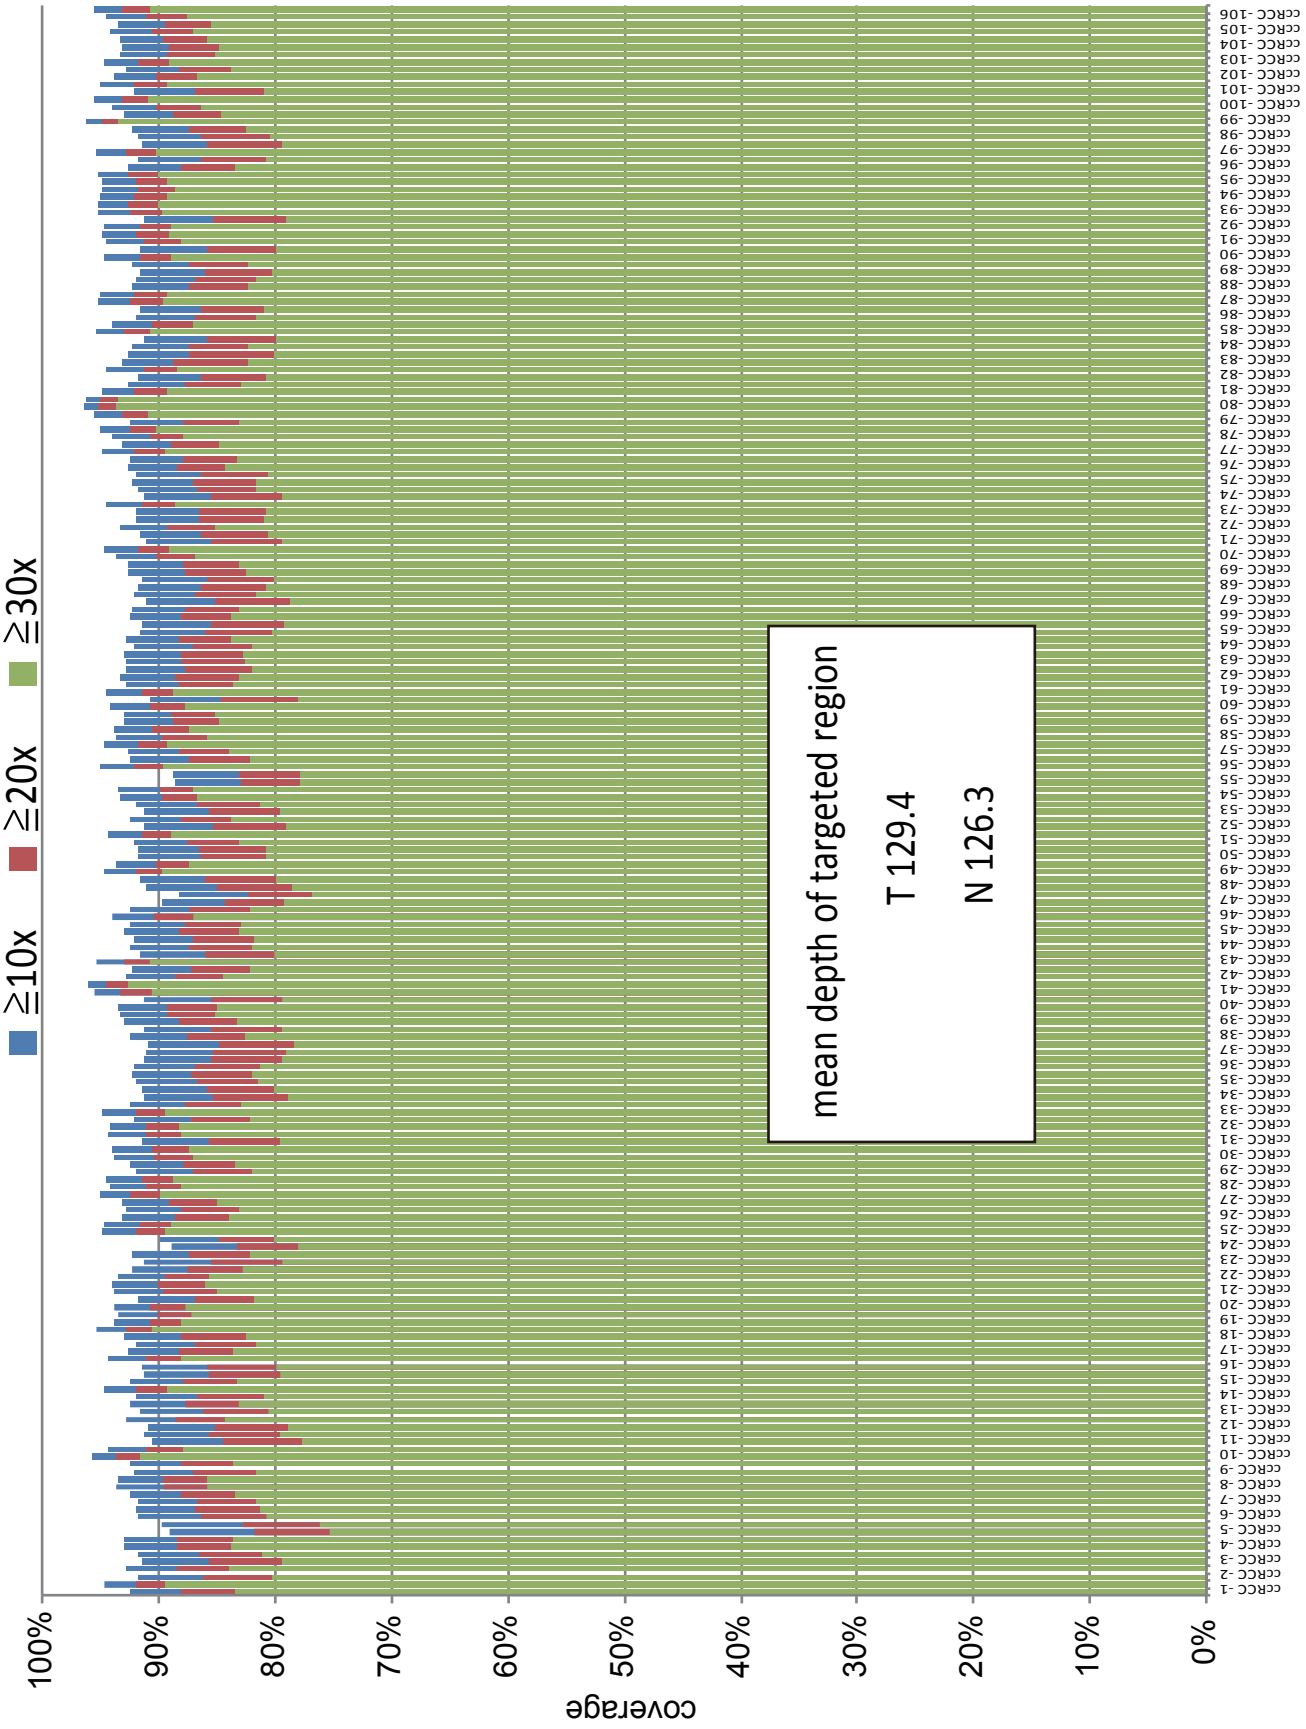
Supplementary Figure 3



Circos plots of 14 ccRCC genomes
Locations of non-silent mutations, including missense (orange), nonsense (blue) and frameshift (green) mutations are indicated. Total (black) and allele-specific (red and green) genomic copy numbers and structural variations (transverse lines) are indicated in the inner circles. Sample IDs are shown at the top of each circos.

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 4

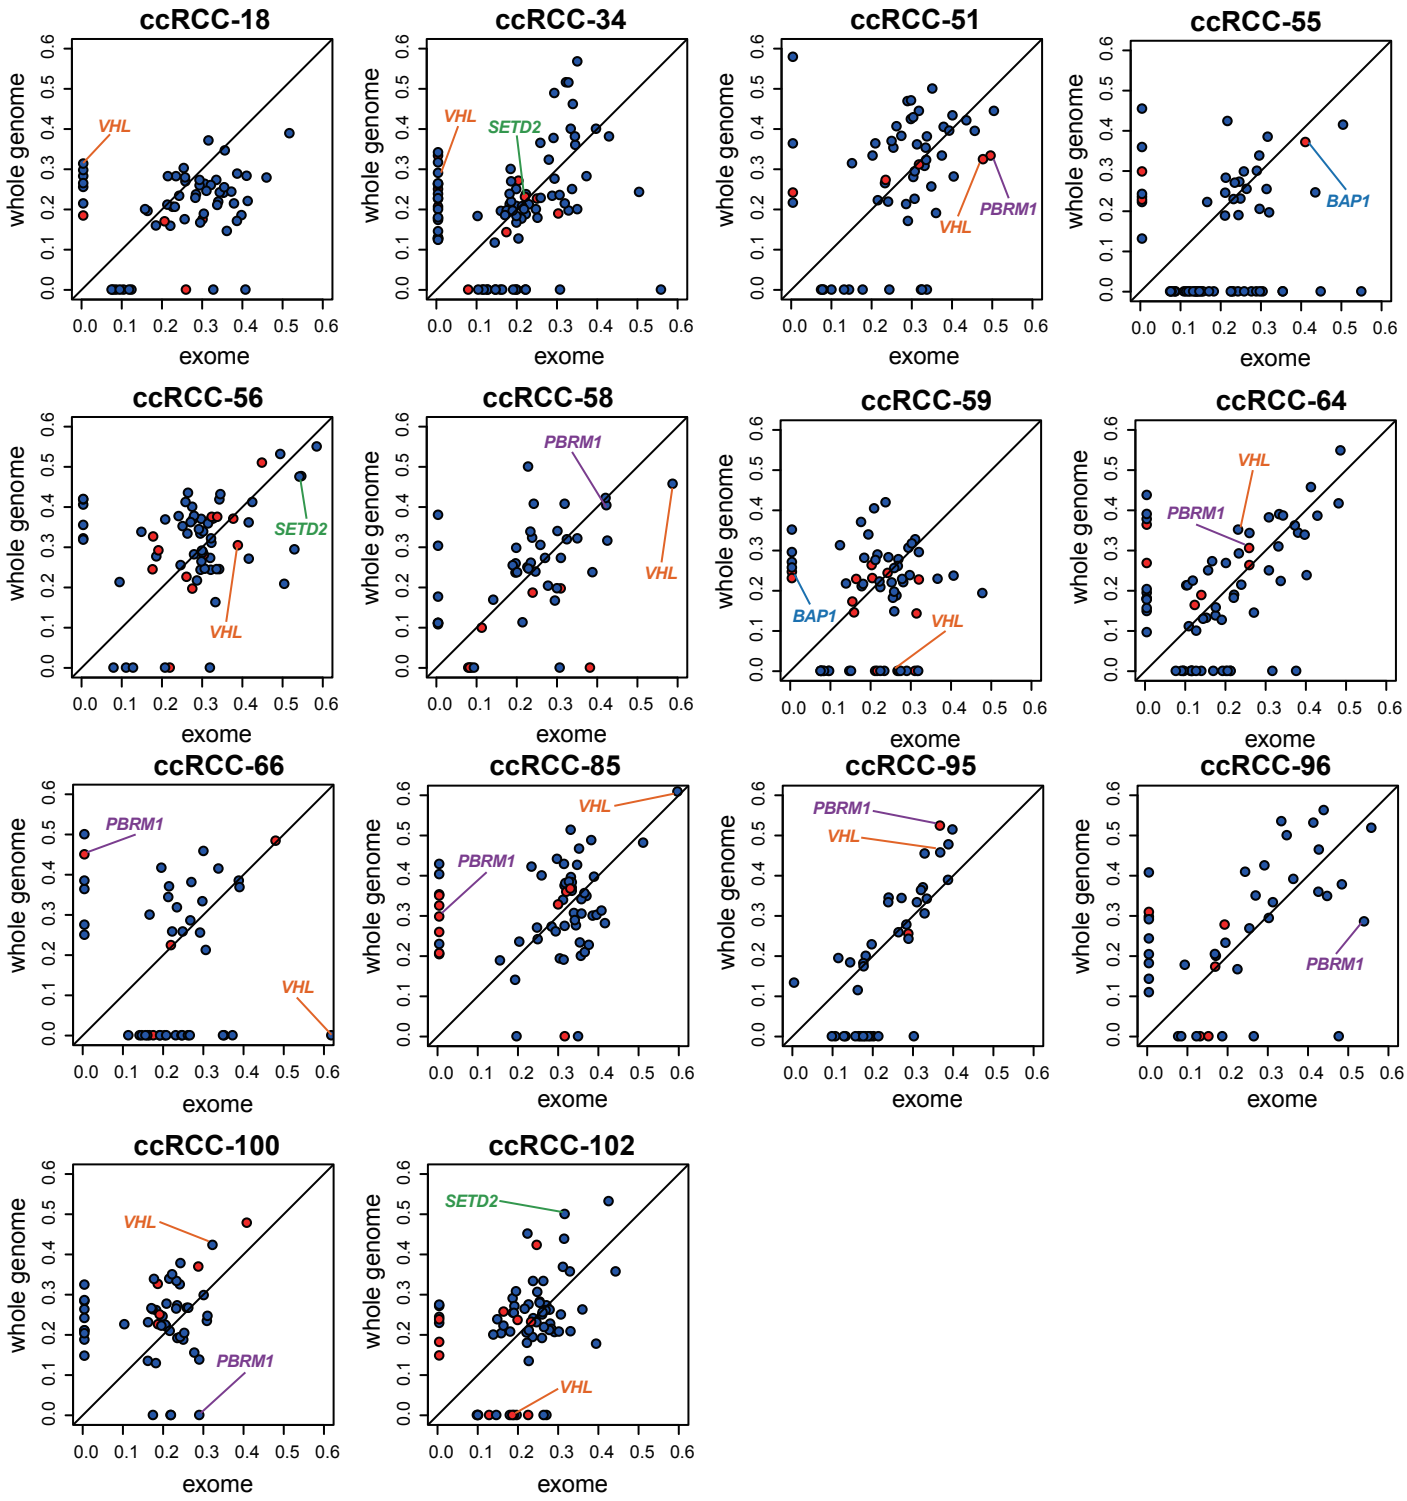


Mean coverage by whole-exome sequencing for paired tumor (T)/normal (N) DNA from 106 ccRCC cases.

Fractions of target exome sequences analyzed by the indicated coverage are shown by different colors.

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 5

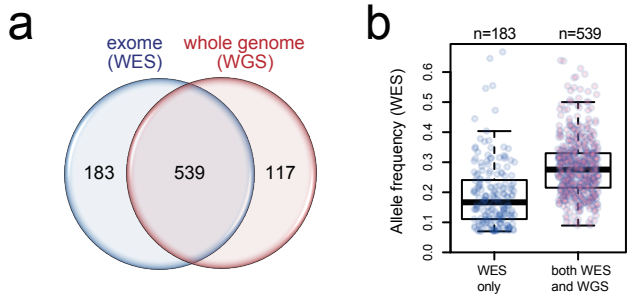


Diagonal plots of validated coding sequence mutations detected by whole-genome and/or exome sequencing for 14 ccRCC specimens analyzed with both platforms

Observed allele frequencies from both sequencing platforms are plotted for each mutation. Major driver mutations are indicated. SNVs are shown in blue whereas indels are shown in red.

Nature Genetics: doi:10.1038/ng.2699

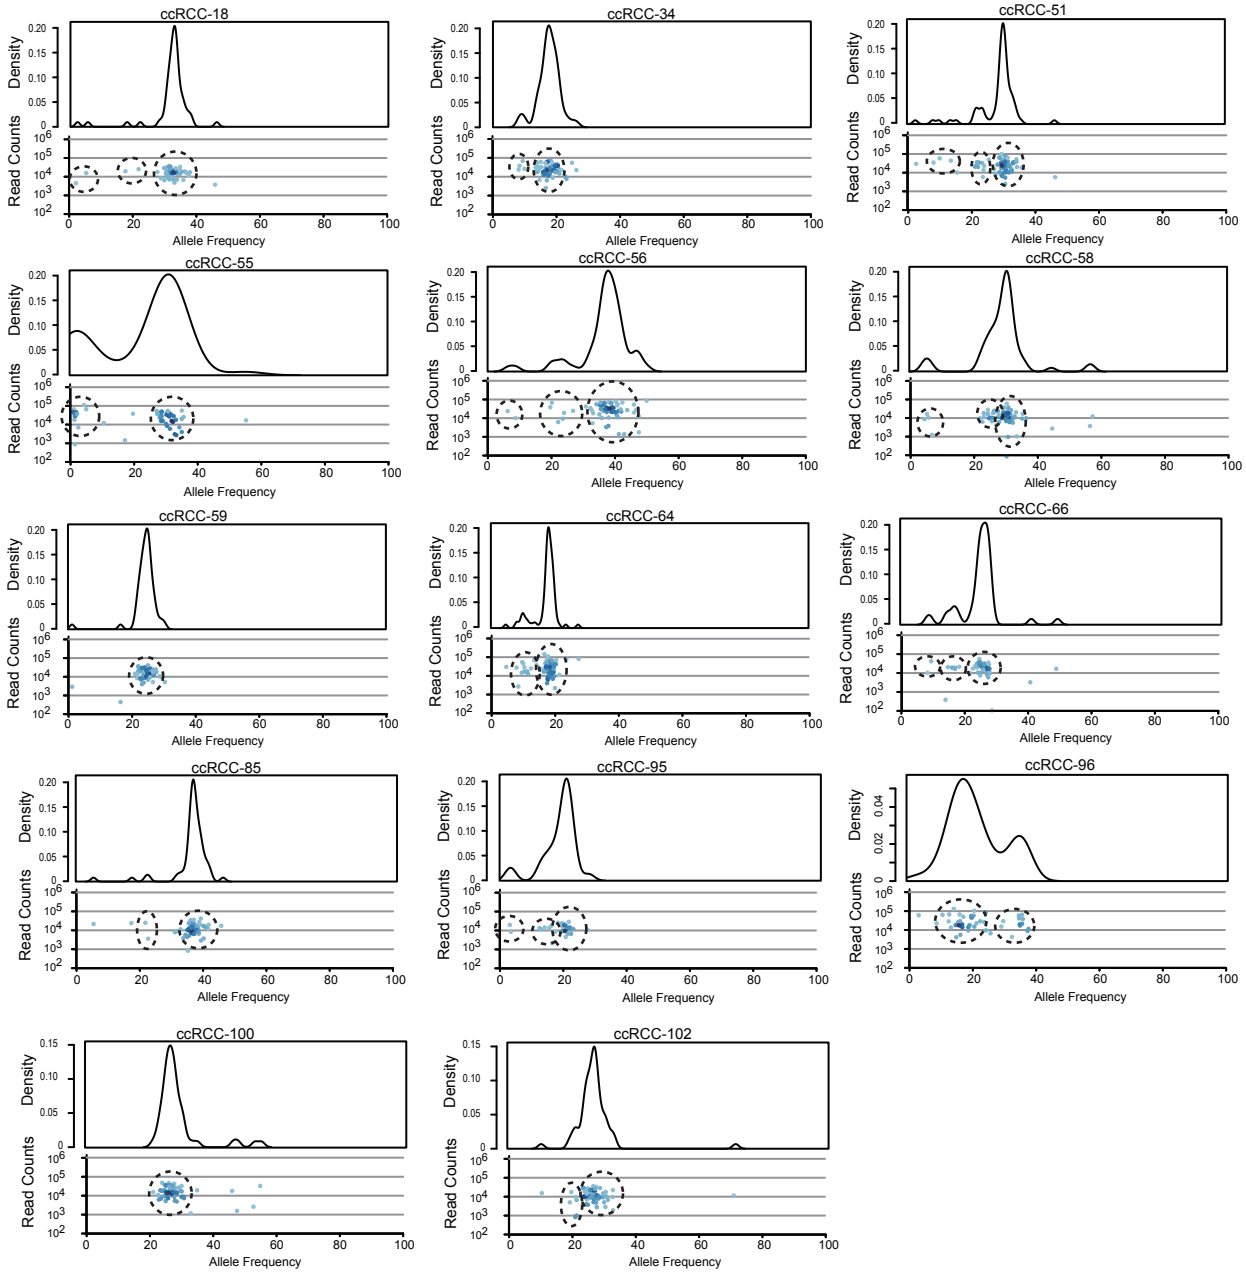
Supplementary Figure 6



Lower allele frequencies of somatic mutations detected only by whole-exome sequencing for 14 ccRCC specimens

(**a**) Number of confirmed somatic mutations detected by whole-genome and/or exome sequencing. (**b**) Comparisons of allele frequencies between validated somatic mutations detected by whole-exome sequencing only and by both whole-genome and exome sequencing.

Supplementary Figure 7

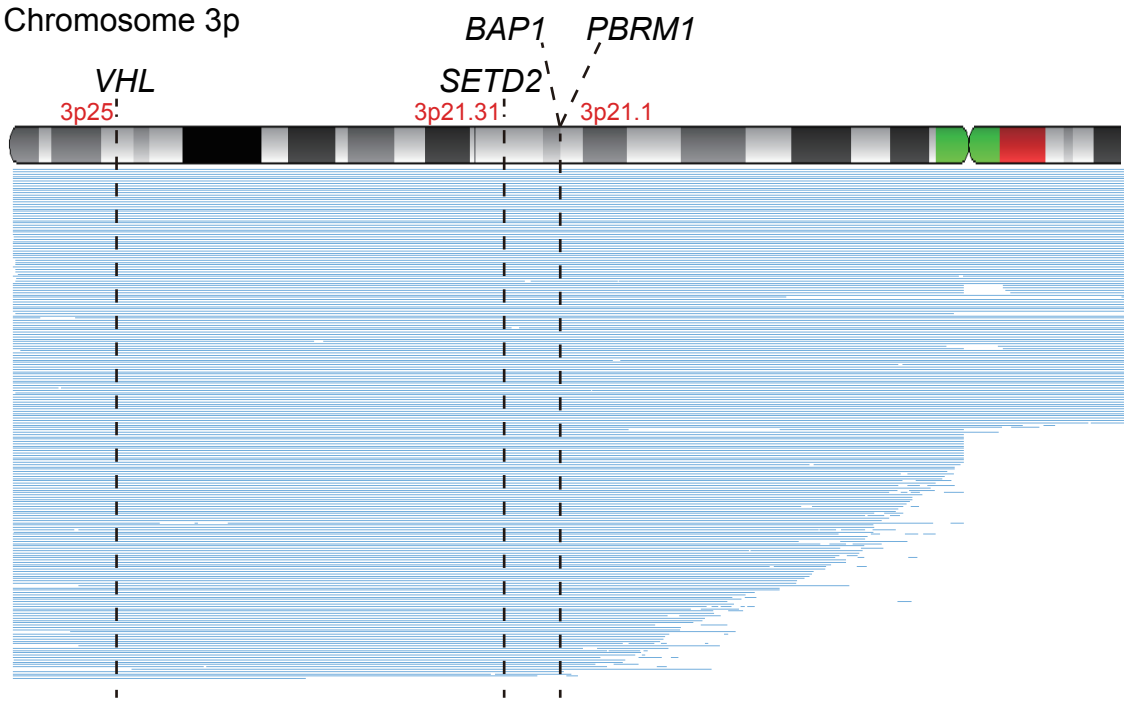


Intratumoral heterogeneity in ccRCC cases

Kernel density estimations of clonal populations based on allele frequencies of observed somatic mutations using deep sequencing (top panels).The frequency of each variant allele is plotted against the total number of sequencing reads that covered the corresponding nucleotide positions (bottom panels).

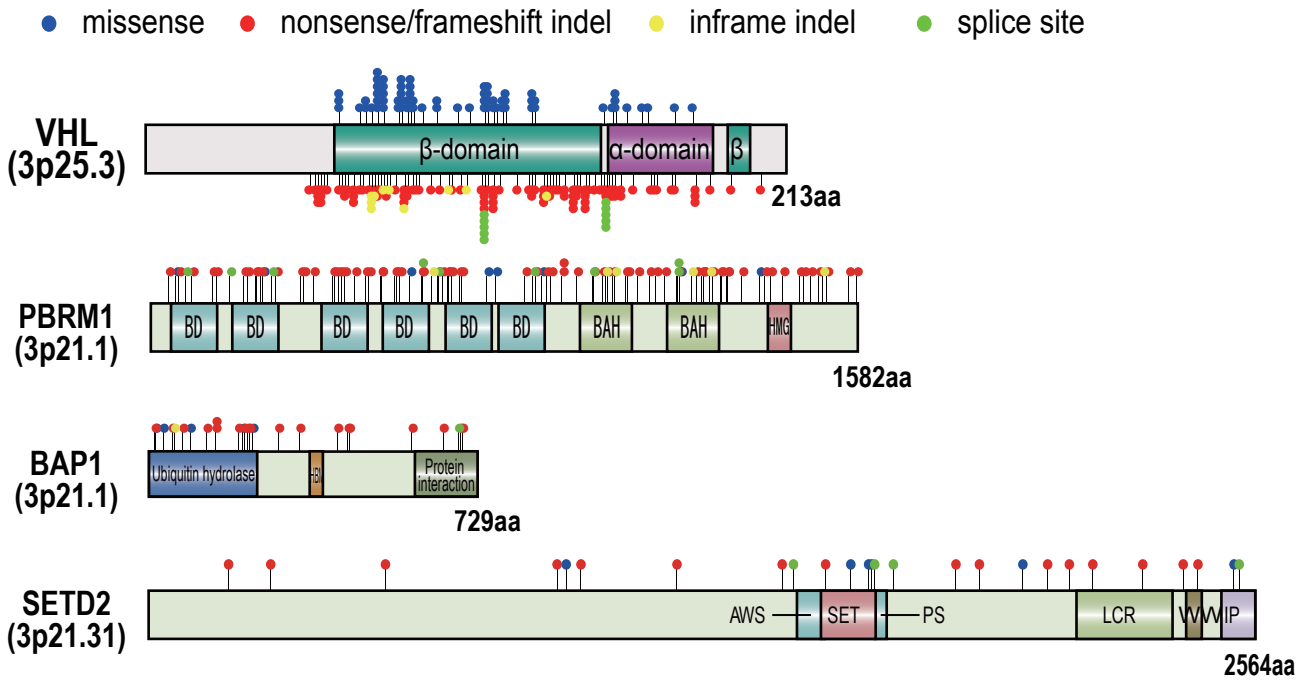
Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 8



LOH mapping in the 3p arm in ccRCC
LOH in the 3p arm found in a total of 226 ccRCC cases by SNP array analysis. The genetic loci of the 4 major targets of 3p LOH are indicated in which the *PBRM1* locus demarcates the common LOH regions.

Supplementary Figure 9

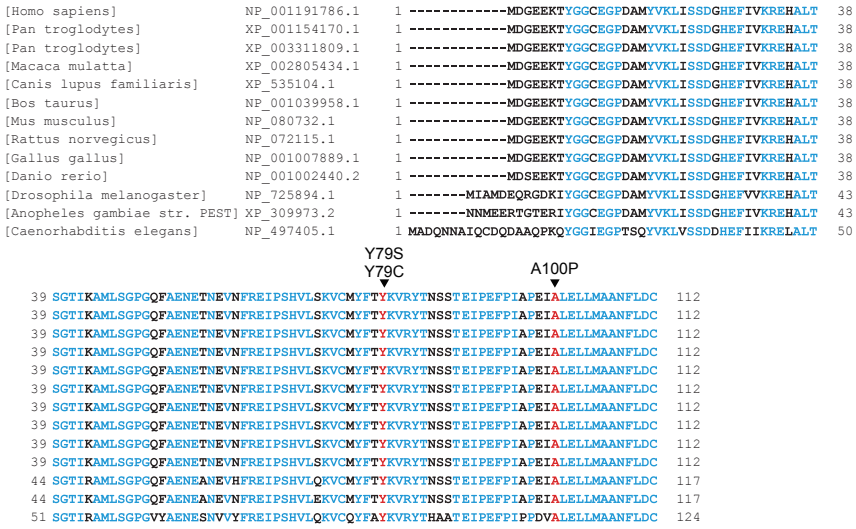


Mutation distributions in 3p targets, including *VHL*, *PBRM1*, *SETD2* and *BAP1*
Mutations of *VHL, PBRM1, SETD2* and *BAP1* in a cohort of 240 ccRCC cases. Types of mutations are distinguished by the indicated colors.

Nature Genetics: doi:10.1038/ng.2699

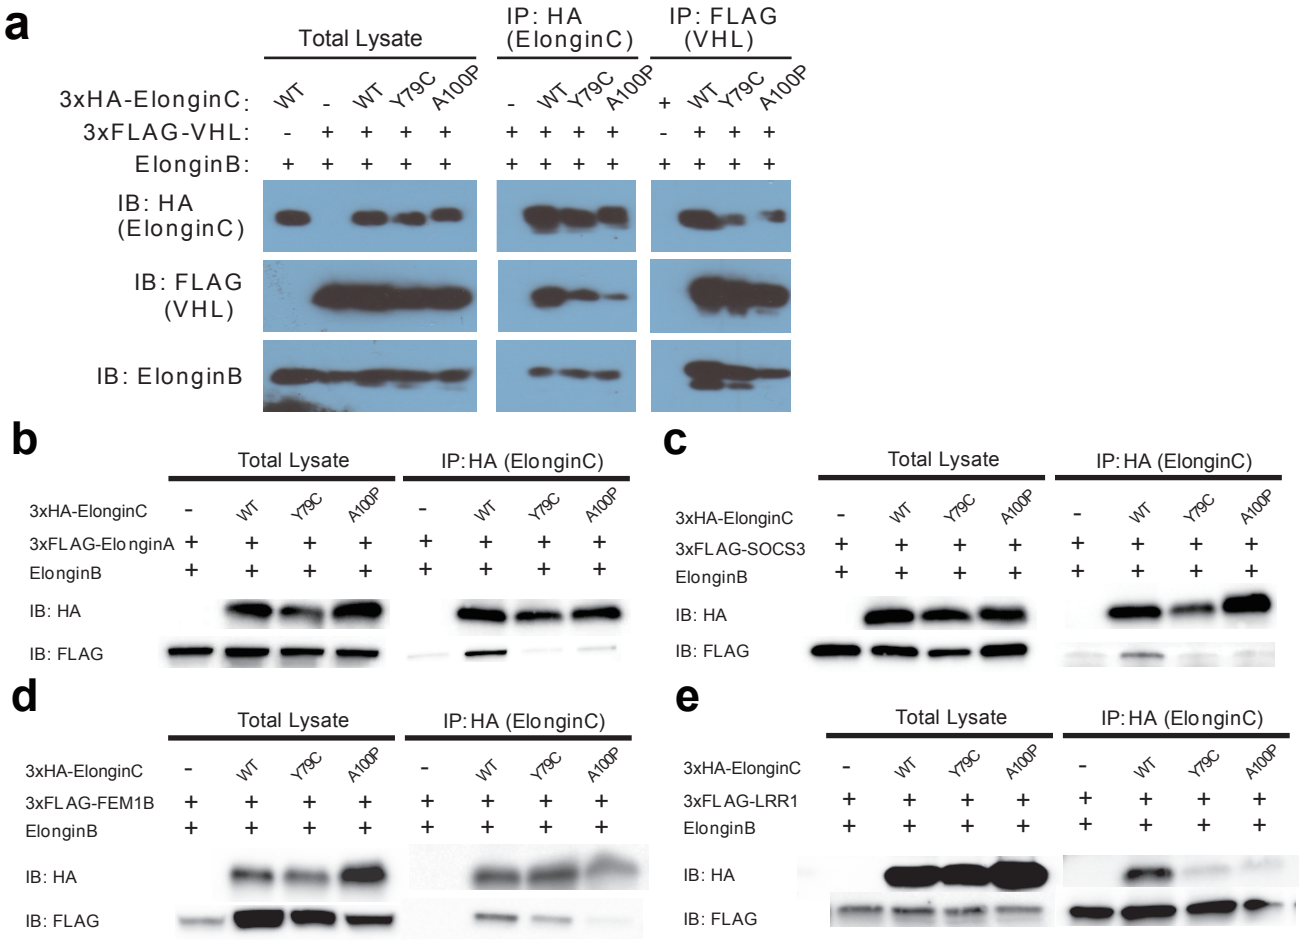
Supplementary Figure 10

Elongin C (*TCEB1*)



Amino-acid sequence alignments for Elongin C (TCEB1) from different species
Completely conserved amino acids among all species are indicated in blue; mutational hot spots are shown in red.

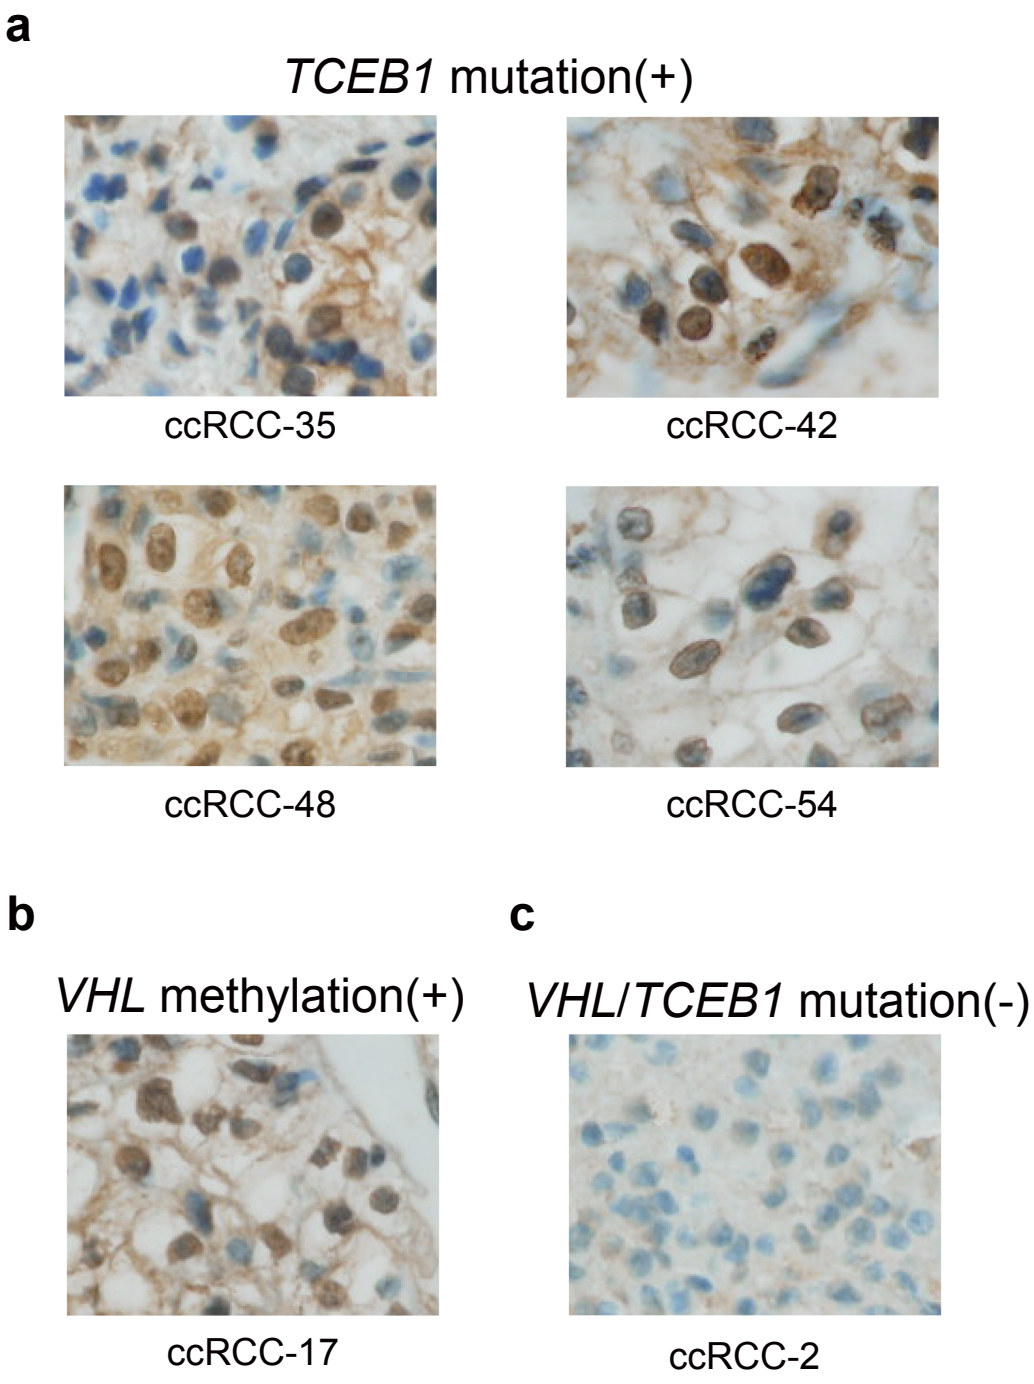
Supplementary Figure 11



Compromised binding of mutant Elongin C (TCEB1) to VHL and other BC-box proteins
(**a**) Western blotting for indicated components of the VHL complex in total cell lysates (left panels), and precipitated with anti-HA (Elongin C) (middle panels) and anti-FLAG (VHL) in lysates from 293T cells transduced with the indicated mock, wild-type or mutant 3xHA-tagged Elongin C, Elongin B and 3xFLAG-tagged VHL. (**b-e**) Western blot analyses of BC-box proteins in total cell lysates (left panels) and precipitated with anti-HA (Elongin C) or anti-FLAG (BC-box protein) (right panels) in lysates from 293T cells transduced with either mock, wild-type, mutant 3xHAtagged Elongin C, Elongin B and 3xFLAG-tagged Elongin A (**b**), SOCS3 (**c**), FEM1B (**d**) and LRR1 (**e**).

Nature Genetics: doi:10.1038/ng.2699

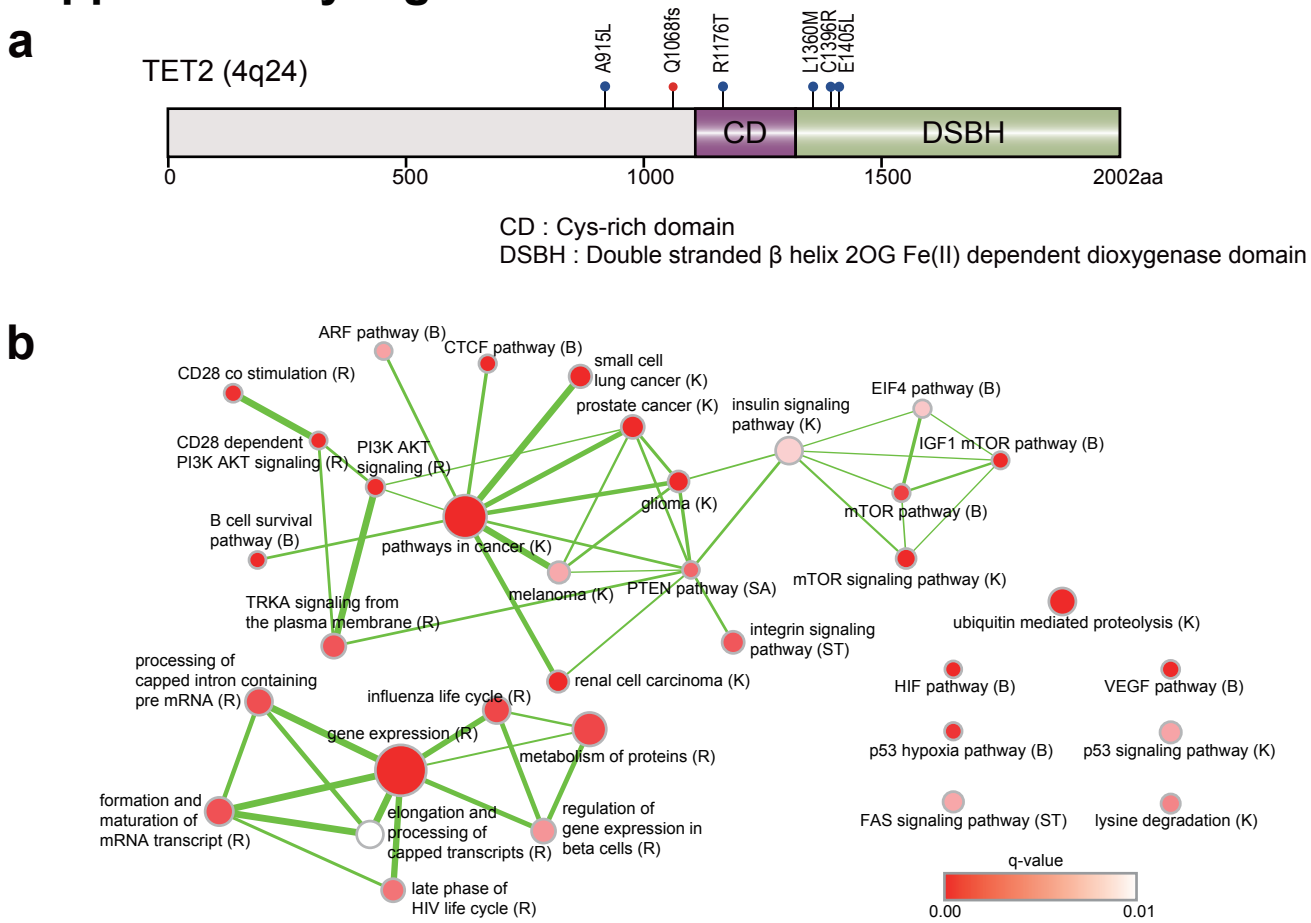
Supplementary Figure 12



HIF1α expression in IHC
Increased HIF expression was confirmed in *TCEB1* mutated tumors (**a**) as well as a tumor with *VHL* promoter methylation (**b**), but not in a tumor without *VHL*/*TCEB1* alterations (**c**).

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 13



Significantly mutated genes/pathways in 106 exome cases

(**a**) TET2 mutations in ccRCC. Type and position of TET2 mutations are indicated. (**b**) Significantly mutated pathways are shown in red circles based on the significance level (*q* values) as indicated by the color gradient. (B):Biocarta (K):KEGG (R):Reactome (ST):Signaling Transduction KE (**c**) Somatic mutations observed in the apparatus for mRNA processing.

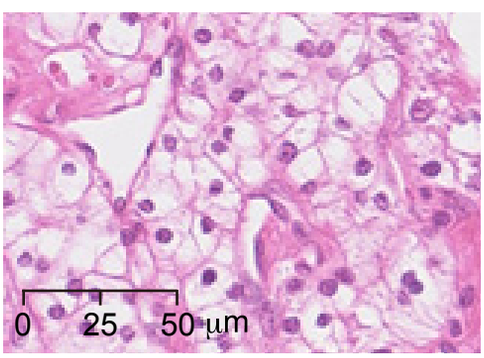
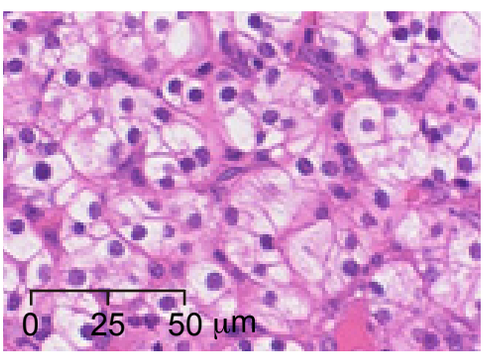
ccRCC-51

NRF2 mutation



ccRCC-82

CUL3 mutation

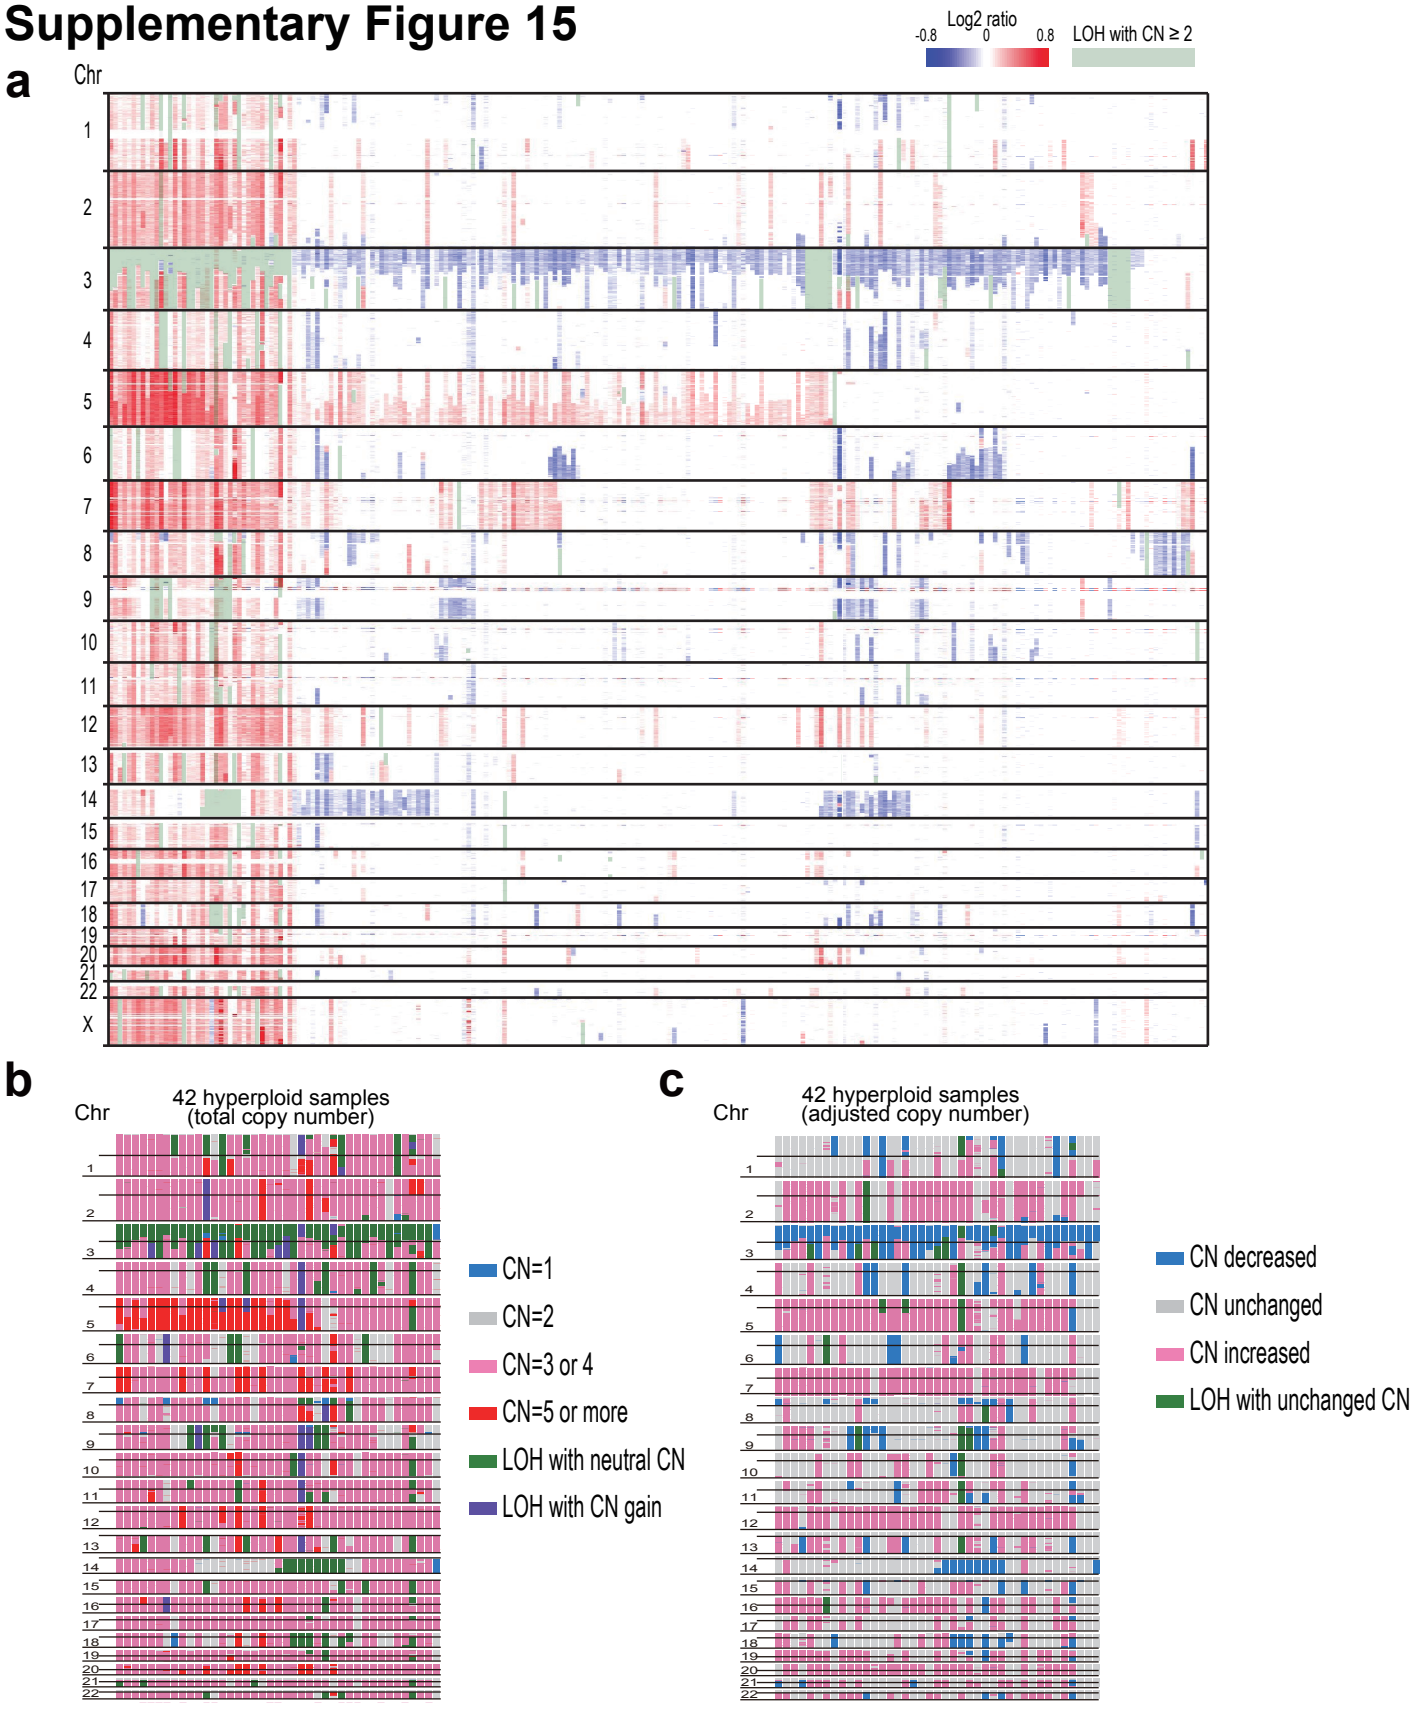


ccRCC-18

Histologies of tumors having *KEAP1*/*NRF2*/*CUL3* mutations.
All cases were confirmed as clear cell RCC with no papillary components on HE staining.

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 15

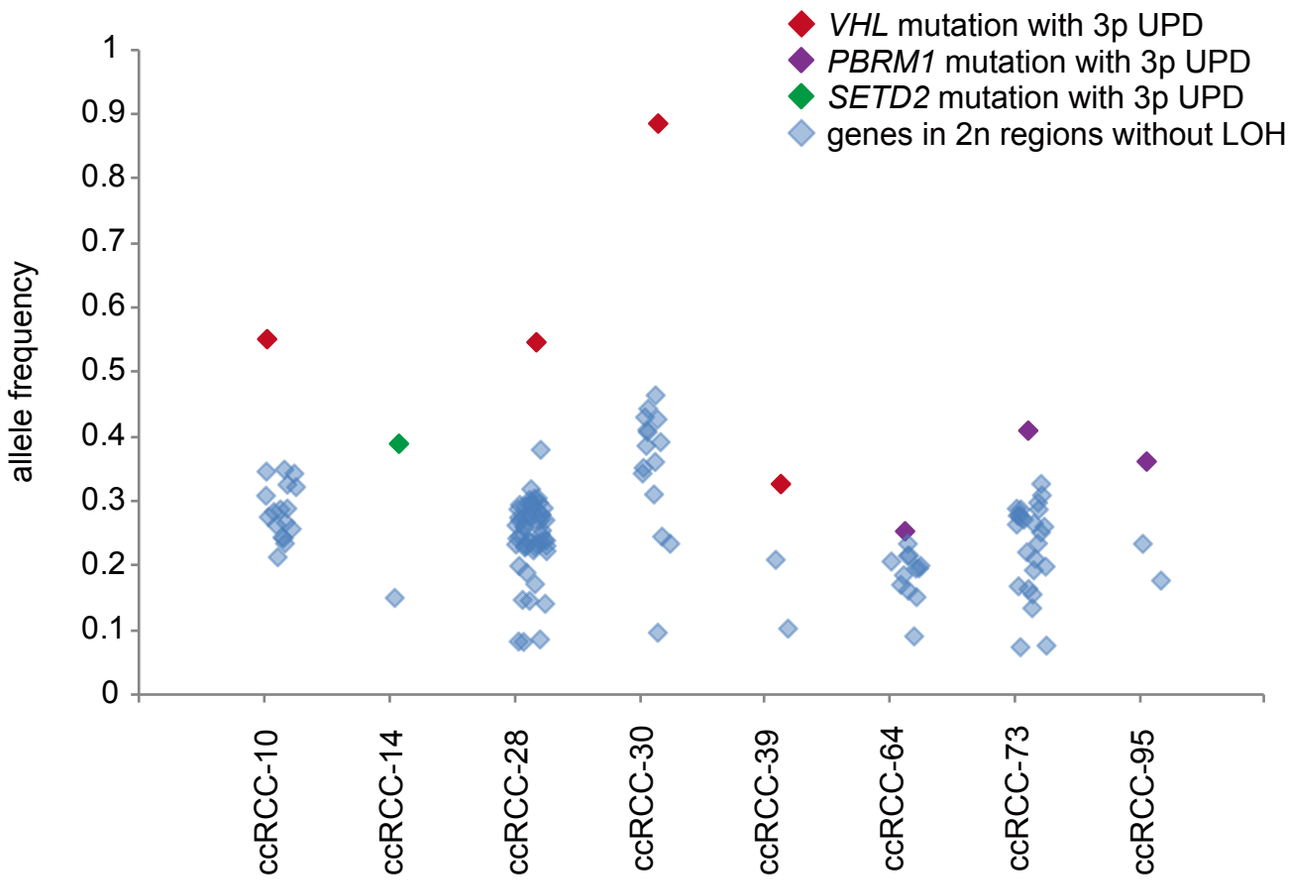


Copy number profiles of 240 ccRCC specimens

(**a**) Genomic copy number determined by SNP array analysis are shown by a color gradient based on CNAG output for 240 ccRCC specimens. Regions showing copy neutral LOH are overlayed in light green. Samples were clustered based on major copy number lesions, including hyperploidy, 3p loss, 5q gain, 14q LOH, 9p LOH and other abnormalities. (**b**) Genomic copy numbers inferred by HMM based analysis of 42 hyperploid samples are shown by the indicated colors. (**c**) The copy number plots for hyperploid cases (b) were transformed by calculating relative copy numbers to the base line copy number (=3), in which the copy number status was either increased (CN > 3, pink), decreased (CN < 3, blue), or unchanged (CN = 3, gray). This relative copy number profile was an essentially identical to that for diploid samples (a), characterized by losses of 3p, 4q, 6q, 9p,9q, 14q and gains of 5q and 7q, suggesting that these hyperploid tumors were most likely progressed from diploid tumors as a relatively late event.

Nature Genetics: doi:10.1038/ng.2699

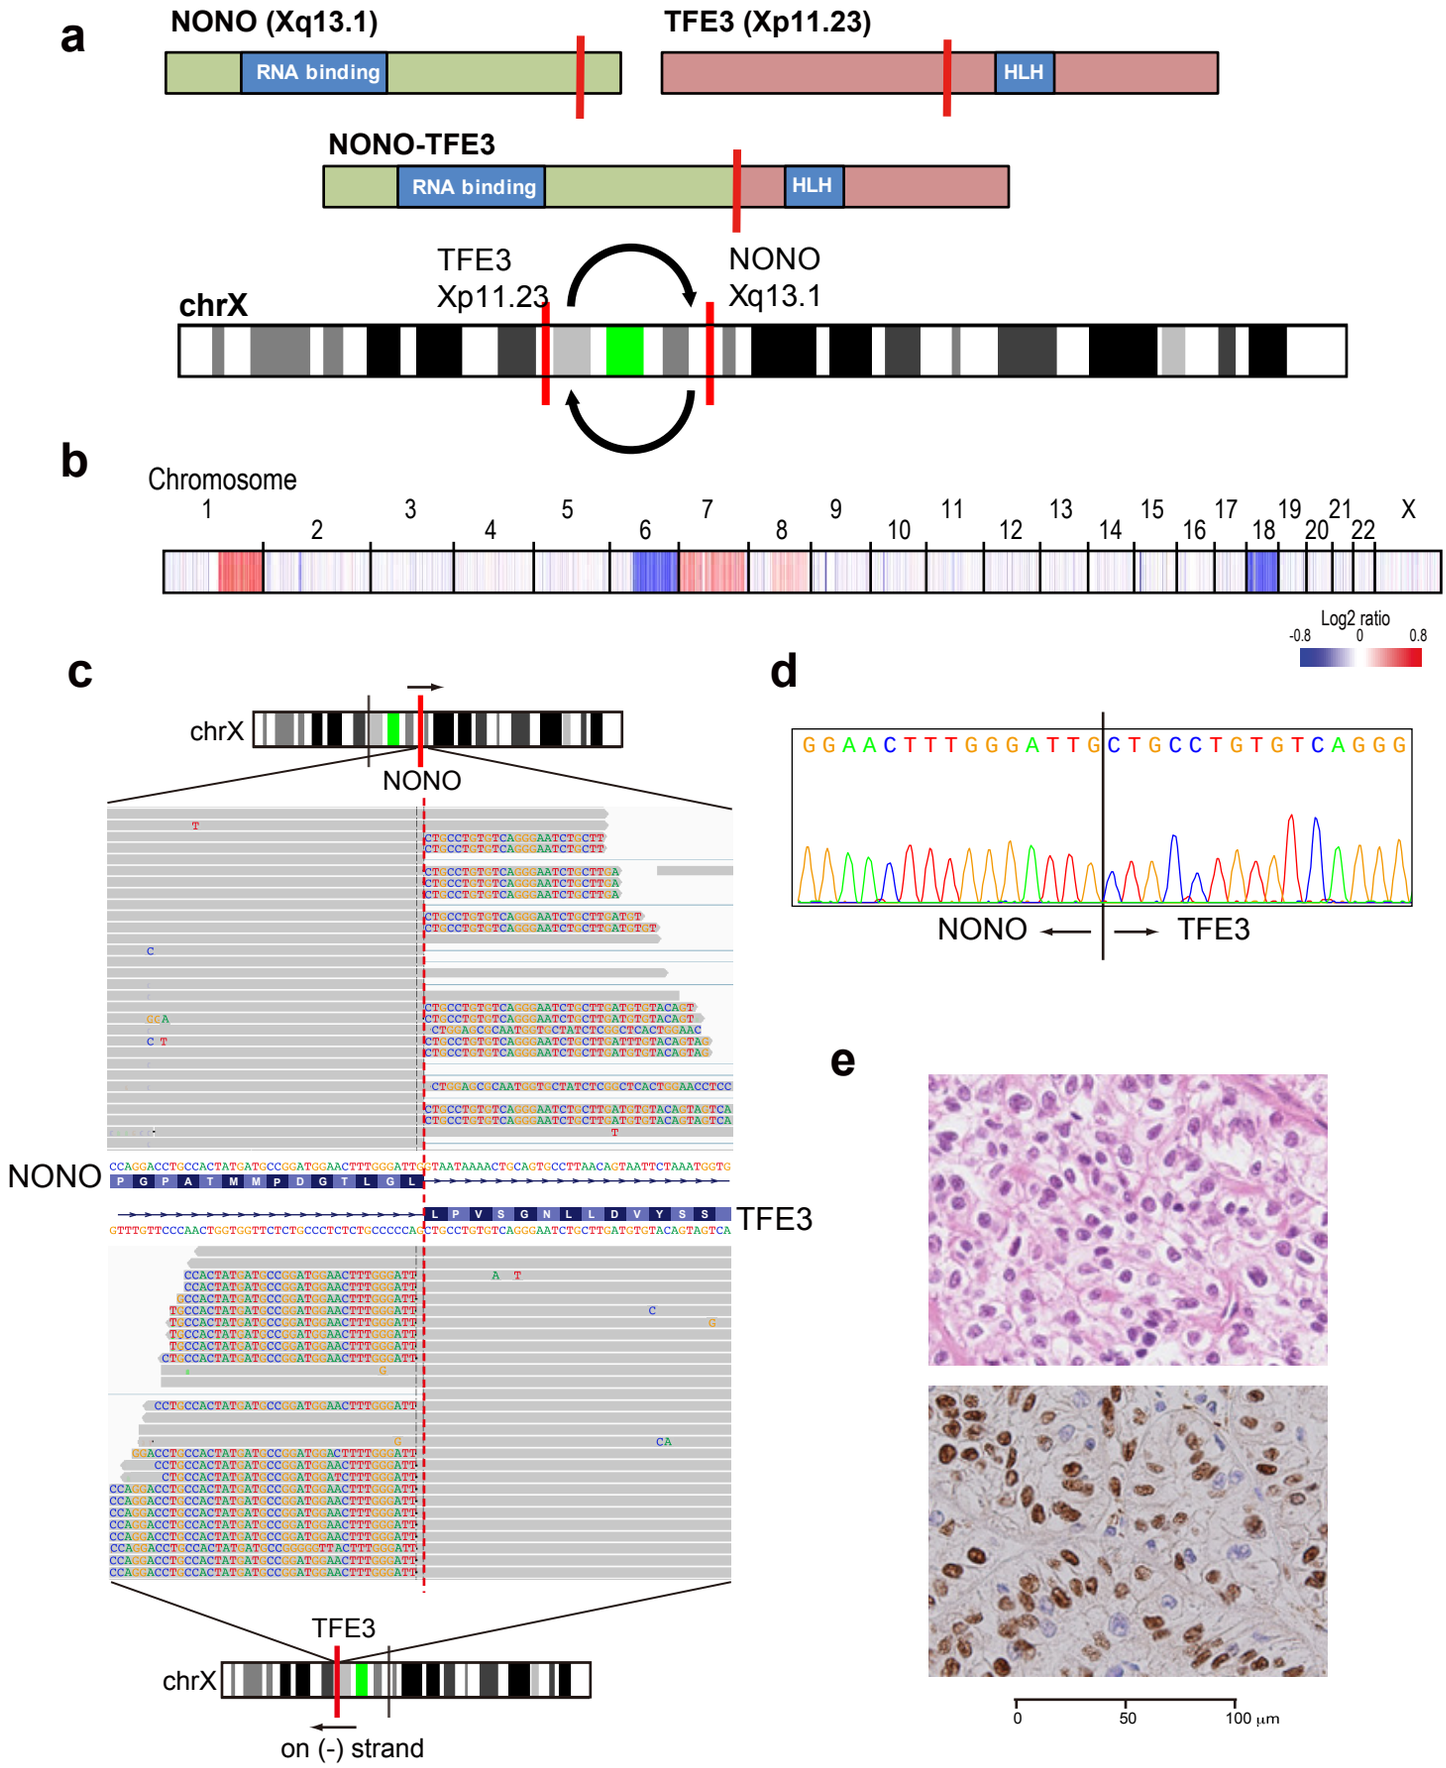
Supplementary Figure 16



Higher allele frequencies of mutations in the 3p target genes in cases with 3p UPD. 8 out of 25 cases with 3p UPD had mutations in either *VHL*, *PBRM1* or *SETD2*, which were analyzed by enough depths (> 50x) with whole exome sequencing for accurate estimation of allele frequency and also had one or more mutations in copy number 2n regions. Allele frequencies of 3p target in 3p UPD were higher than those of other mutations within 2n regions in all 3p UPD cases.

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 17

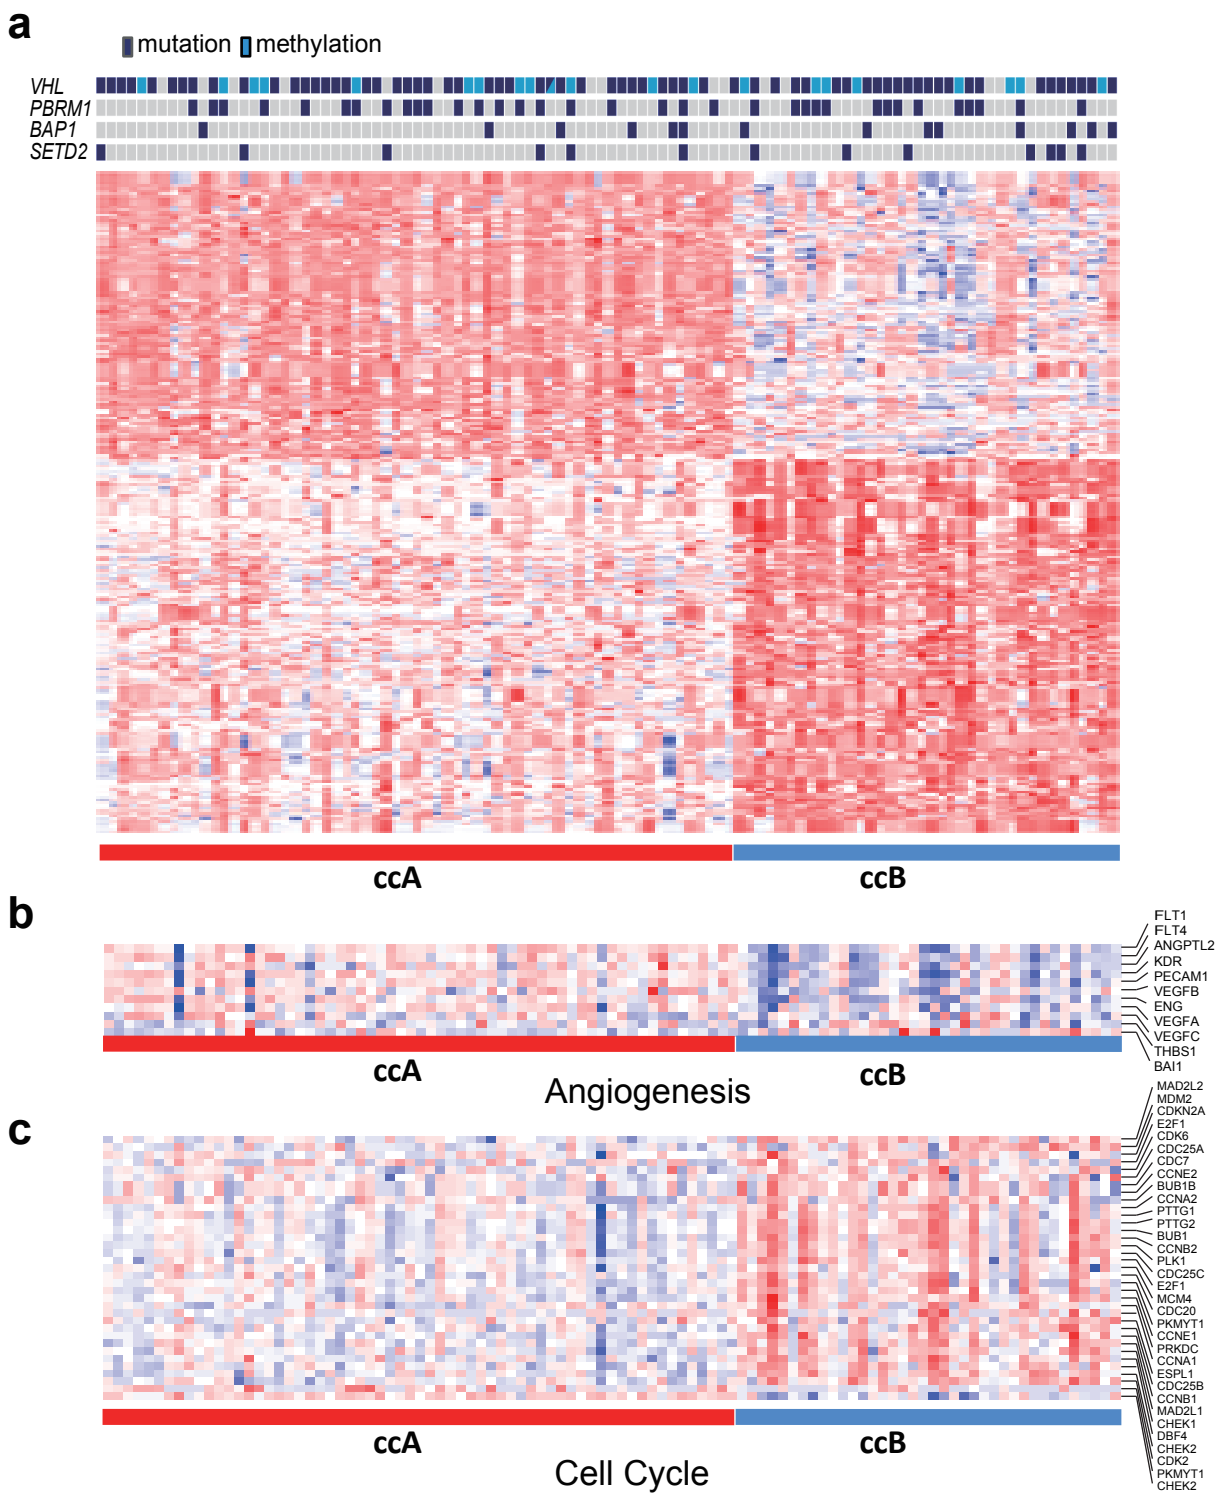


***NONO-TFE3* fusion transcript**

NONO-TFE3 fusion transcript was found in single case (**a**), in which copy number alterations characteristic to ccRCC such as 3p LOH and 5q gain were lacked (**b**). The junction sequence of fusion transcript was showed with IGV viewer (**c**) and confirmed with sanger sequencing (**d**). (**e**) The tumor was positive for TFE3 in IHC (lower panel) but hardly distinguishable from other ccRCC cases on HE staining (upper panel).

Nature Genetics: doi:10.1038/ng.2699

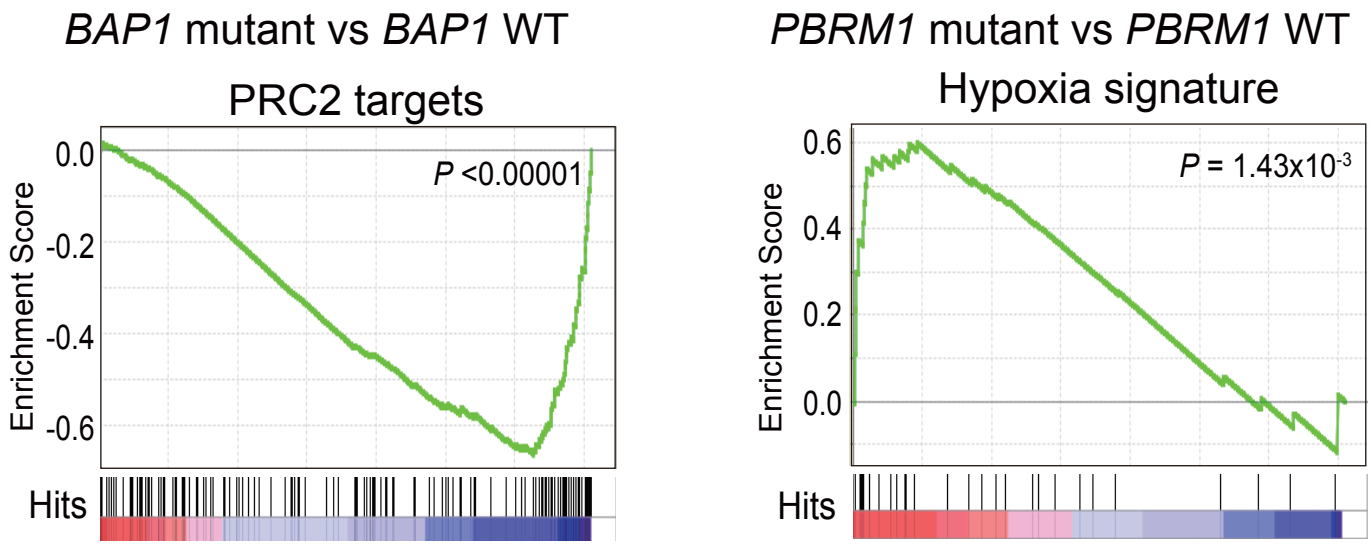
Supplementary Figure 18



ccA and ccB clusters identified from the expression profiles of 101 ccRCC samples
K-means clustering for 101 ccRCC specimens based on the expression of genes showing 2 major gene expression clusters: ccA and ccB (**a**). These were discriminated by the expression of genes involved in angiogenesis (**b**) and cell cycle progression (**c**). Mutation status of *VHL, PBRM1, BAP1* and *SETD2* is indicated in the top panels.

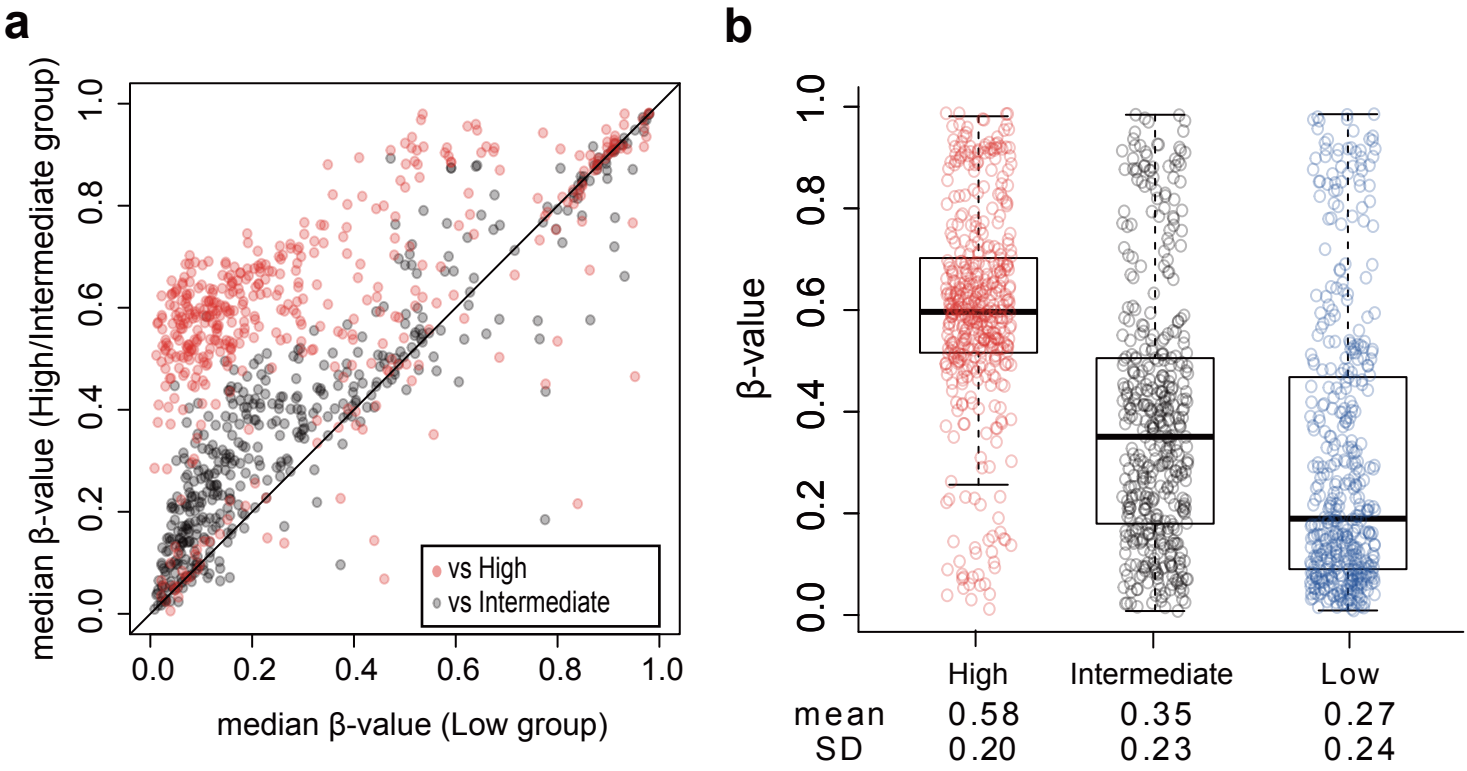
Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 19



Different expression signatures between *BAP1*- and *PBRM1*-mutated tumors. Gene set enrichment analysis showed *BAP1*-mutated tumors showed significantly down-regulated expression of the PRC2 target genes, whereas *PBRM1*-mutated tumors were enriched for an up-regulated expression of gene set of hipoxia signature.

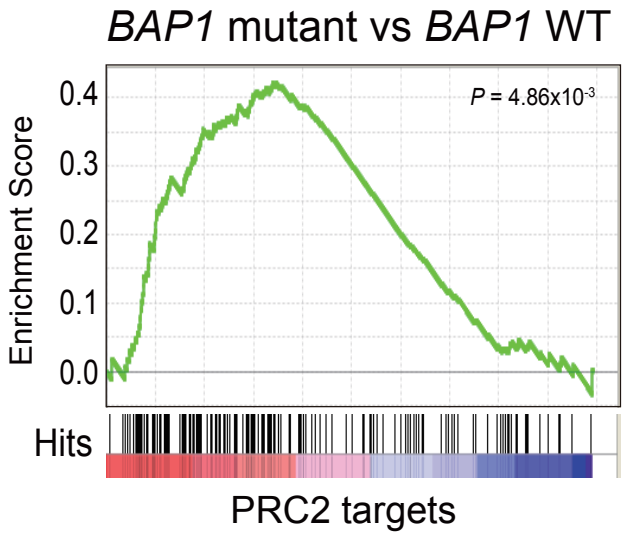
Supplementary Figure 20

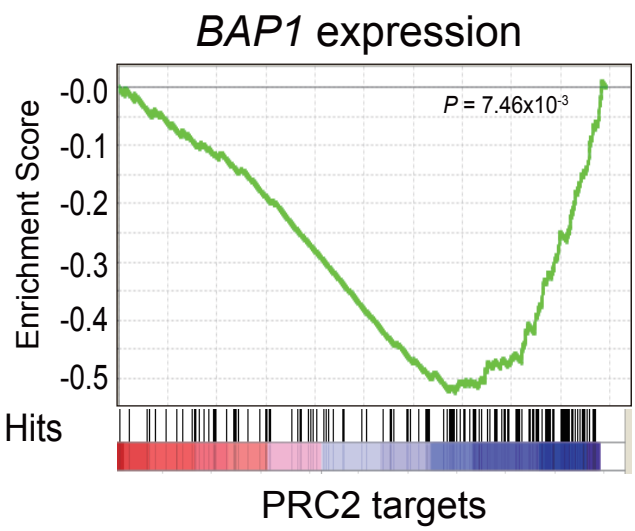


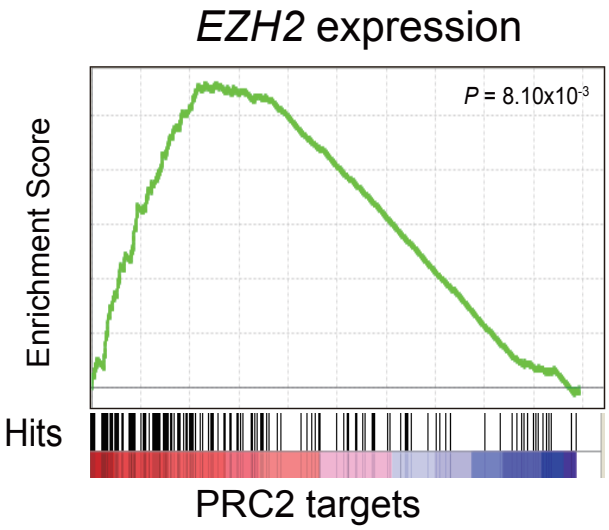
Difference of methylation level among high/intimidate/low methylation clusters
(**a**) Median methylation levels (β values) are plotted for Low and High (red circles) and Low and Intermediate (black circles) methylation clusters for CpG island probes selected for unsupervised clustering analysis in Infinium 450K arrays. (**b**) Distribution of median methylation values (β values) are plotted within each methylation cluster (High, Intermediate and Low).

Nature Genetics: doi:10.1038/ng.2699

Supplementary Figure 21







Association between methylation of PRC2 target genes and *BAP1* mutation/expression and *EZH2* expression

Gene set enrichment analysis showed *BAP1* mutation, decreased *BAP1* expression and increased *EZH2* expression were significantly associated with increased methylation of PRC2 target genes.

Nature Genetics: doi:10.1038/ng.2699
