Large intergenic non-coding RNA-RoR modulates reprogramming of human induced pluripotent stem cells

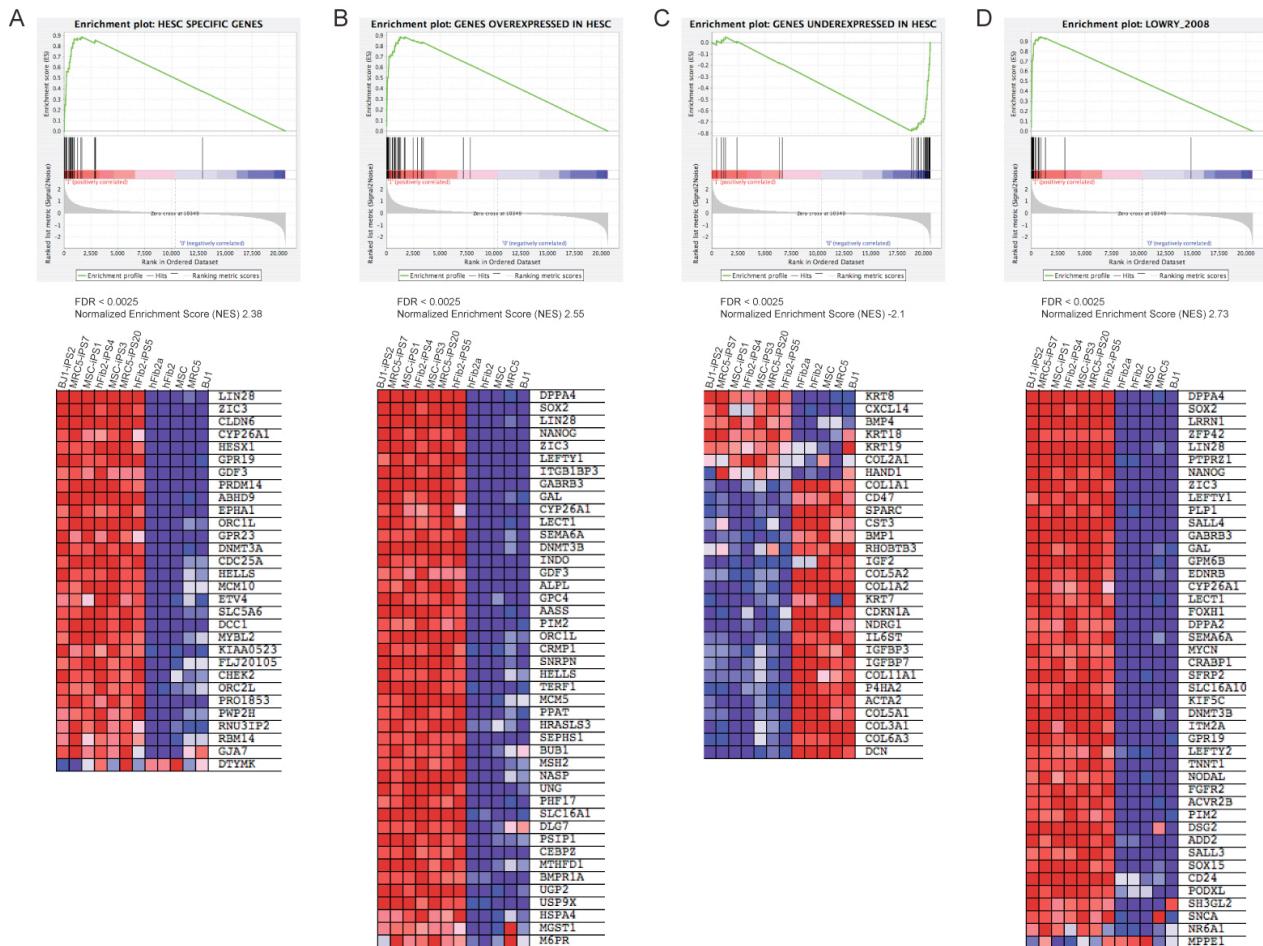

Sabine Loewer, Moran N. Cabili, Mitchell Guttman, Yuin-Han Loh, Kelly Thomas, In Hyun Park, Manuel Garber, Matthew Curran, Tamer Onder, Suneet Agarwal, Philip D. Manos, Sumon Datta, Eric S. Lander, Thorsten M. Schlaeger, George Q. Daley and John L. Rinn

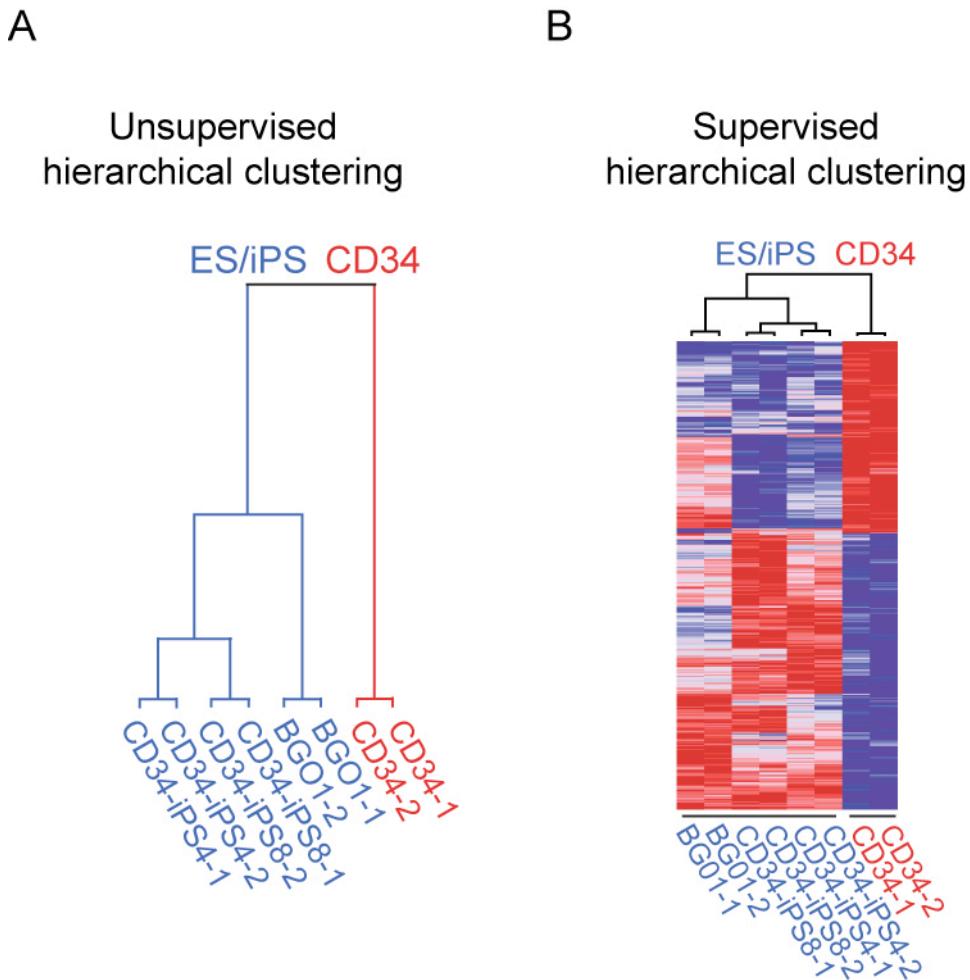

Supplementary Figure 1: Characterization of iPS cell lines used in this study. A) Semi-quantitative RT-PCR (30 cycles) to document silencing of retroviral transgenes in iPSC lines. BG01, MSC: ESC and fibroblast controls, respectively, for detection of pluripotency markers and absence of transgenes. B) qRT-PCR documents the total mRNA levels of reprogramming factor mRNAs of *OCT4*, *SOX2*, *KLF4*, and *MYC* in iPSC lines in comparison with the levels in ESC lines (H1, H9, BG01). mRNA levels are depicted relative to the levels in H1 ESCs. C) Fluorescence immunostaining shows upregulation of SSEA4 and Tra-1-60 surface markers, and absence of transgene expression as reflected by GFP in iPSCs. DNA was counterstained with Hoechst 33342.

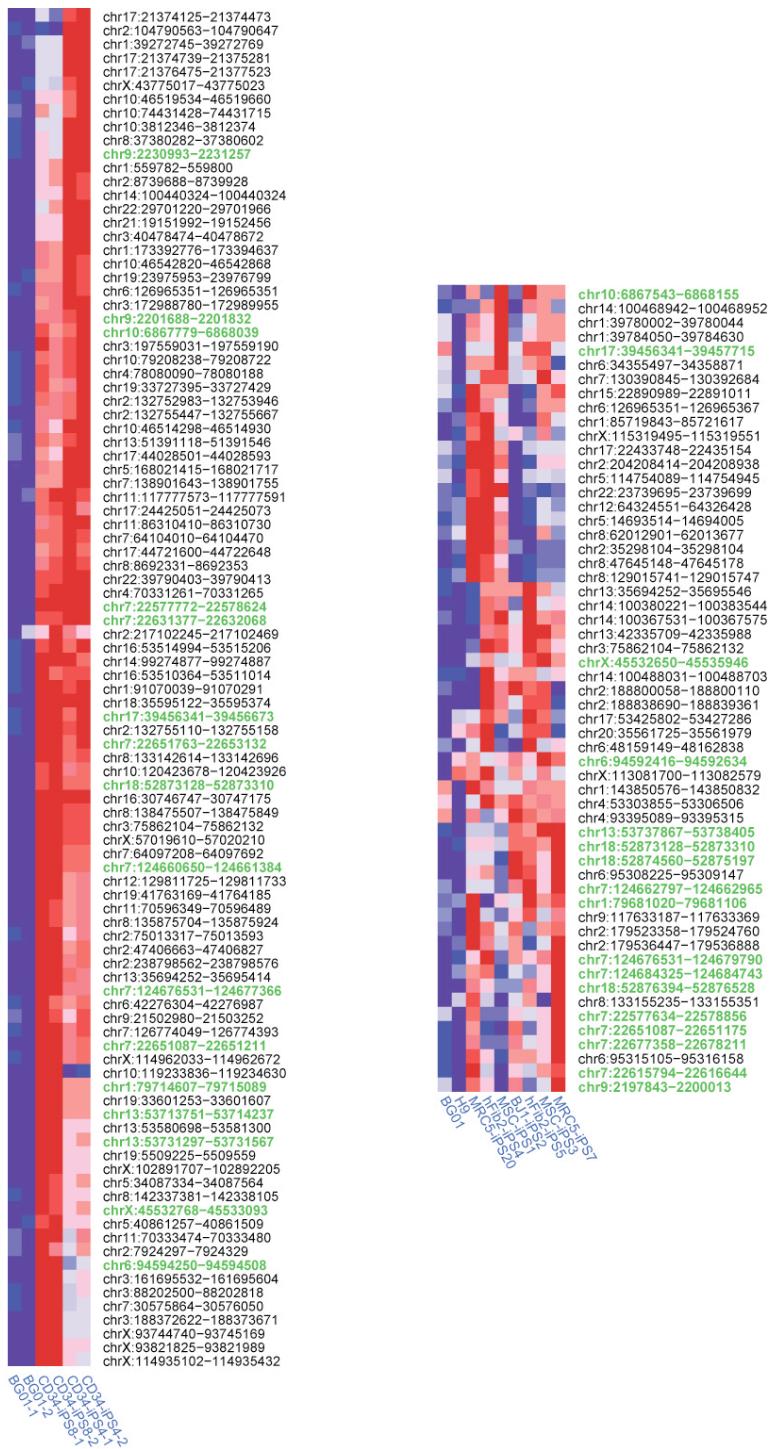

Supplementary Figure 2: Differentiation potential of fibroblast-derived iPSC lines. A) qRT-PCR to document the downregulation of pluripotency markers *OCT4* and *NANOG*, as well as upregulation of differentiation markers of all three germ layers on day 6 of EB differentiation relative to undifferentiated controls. B) Hematoxylin and Eosin (H+E) stained examples of teratomas showing tissues derived from all three germ layers obtained from iPSC injected into the femoral muscle of Rag2 γ c mice.

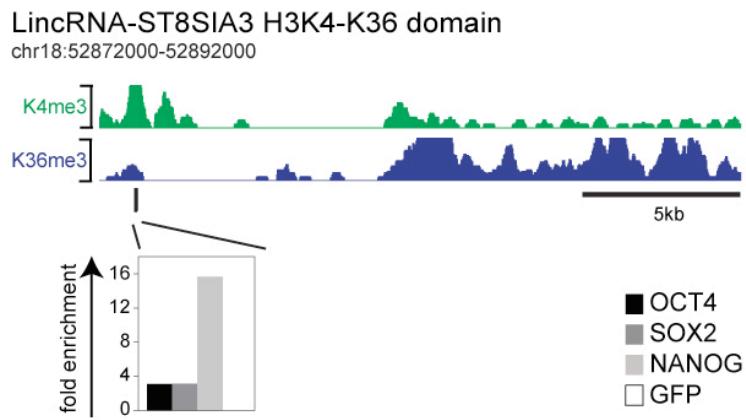

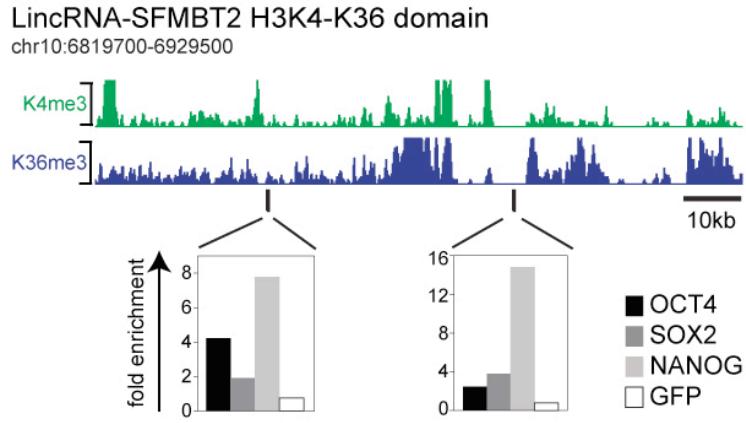

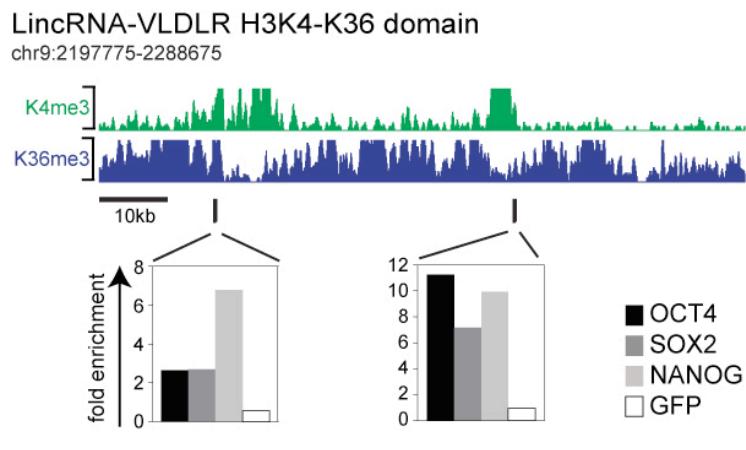

Supplementary Figure 3: Gene Set Enrichment Analysis (GSEA¹) shows that all iPS cell lines used in this study were significantly enriched for human ESC signature genes and depleted of genes normally underexpressed in ESCs. Gene sets were taken from ² and ³, and GSEA was performed using the Gene Set Enrichment Analysis Software (Broad Institute, Cambridge, USA), using 2500 permutations of gene sets (A: Genes specifically expressed in ESCs; B) Genes overexpressed in ESCs relative to other tissues; C) Genes underexpressed in ESCs relative to other cell types; D) Genes characteristic for ESCs taken from ³.

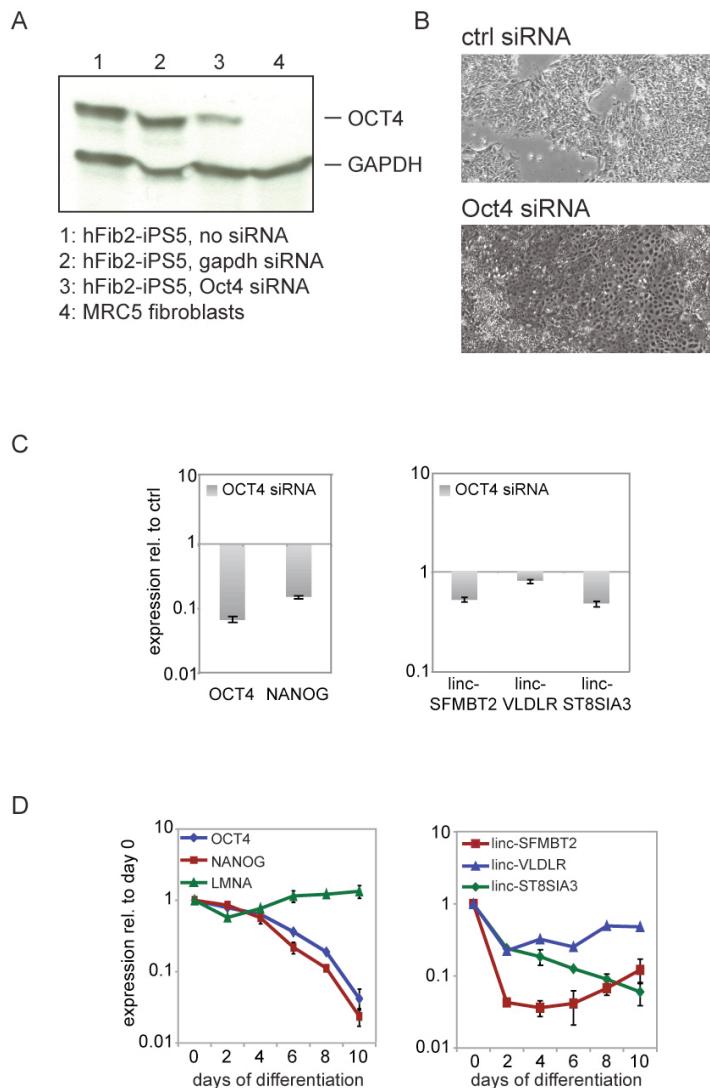

Supplementary Figure 4: Expression analysis of lncRNAs in CD34⁺-derived iPSCs. A) Unsupervised clustering of lncRNA expression segregates CD34⁺ cells (red) from ESCs and CD34⁺-derived iPSCs (blue). B) Supervised clustering analysis identifies 152 lncRNAs that were differentially expressed between ESCs/iPSCs and CD34⁺ cells (>2fold, FWER<0.05). Expression values are represented in shades of red and blue relative to being above (red) or below (blue) the median expression value across all samples (log scale 2, from -3 to +3).

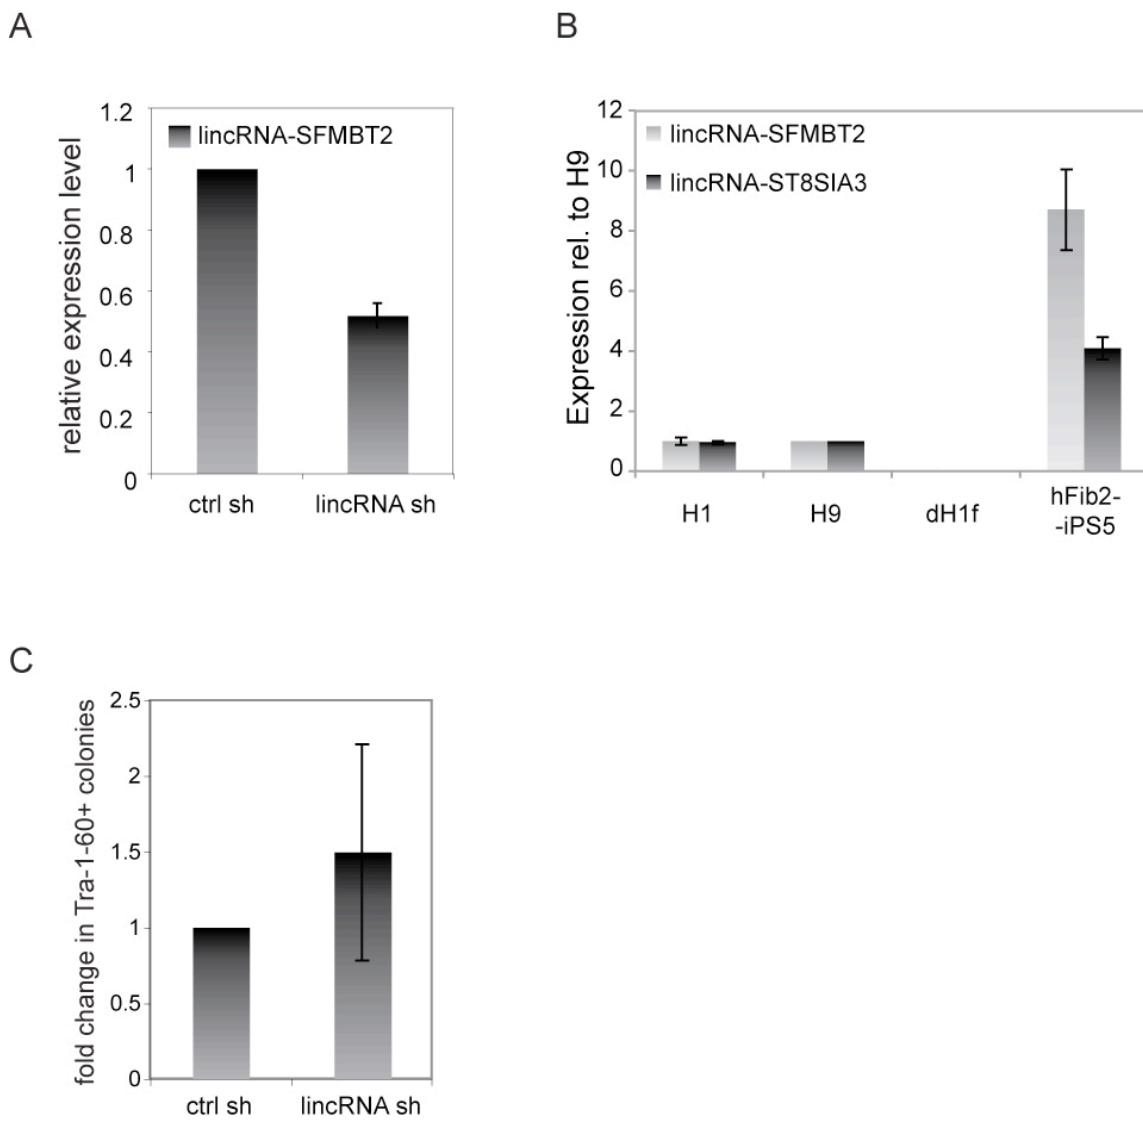

Supplementary Figure 5: Heatmaps from Figure 2A showing lincRNAs with elevated expression in fibroblast-derived iPSCs (left) and CD34⁺-derived iPSCs relative to hESCs (>2fold, FWER<0.05). The chromosomal coordinates of differentially expressed lincRNA segments are indicated, and segments corresponding to the 10 overlapping iPSC-elevated lincRNAs are highlighted in green. Expression values are represented in shades of red and blue relative to being above (red) or below (blue) the median expression value across all samples (log scale 2, from -3 to +3).

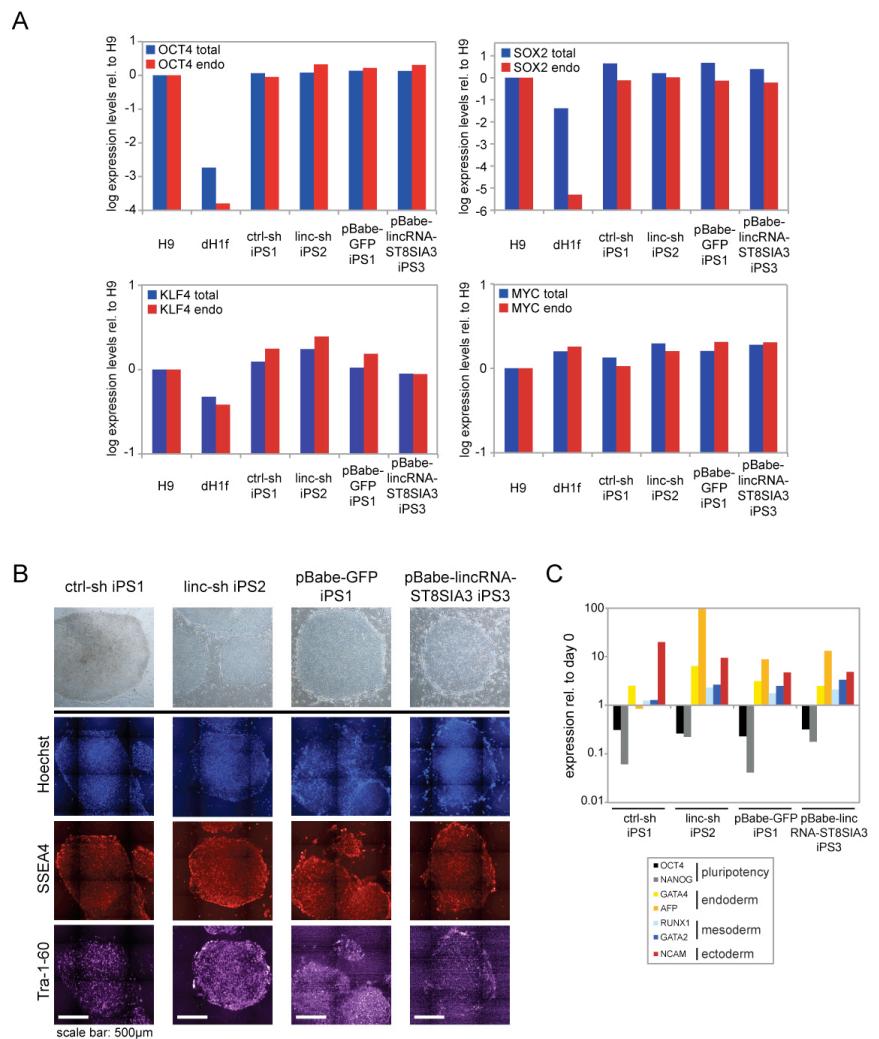

Supplementary Figure 6: ChIP analysis of iPSC-enriched lincRNA loci in BJ1-iPS2 cells. Top: lincRNA loci demarcated by histone H3K4me3 and H3K36me3 domains (green and blue, respectively). Bottom: ChIP in BJ1-iPS2 cells followed by qPCR analysis detects binding of OCT4, SOX2, and NANOG within lincRNA-SFMBT2, lincRNA-VLDLR, and lincRNA-ST8SIA3 regions. ChIP enrichment values are displayed normalized to a control region (chr12: 7,839,777- 7,839,966; hg18).

Supplementary Figure 7: Validation of siRNA mediated knock-down of OCT4 in hFib2-iPS5 cells and analysis of lincRNA expression upon differentiation of H9 cells. A) Western Blot showing reduction of OCT4 protein levels upon siRNA transfection. Lane 1: hFib2-iPS5 cells, no siRNA transfected; lane 2: hFib2-iPS5 cells, transfected with GAPDH control siRNA; lane 3: hFib2-iPS5 cells, transfected with OCT4 siRNA; lane 4: MRC5 fibroblasts as negative control. B) Cell morphology changes upon knock-down of OCT4 (right) compared to a control siRNA transfected sample (left). C) Changes in iPSC-enriched lincRNA levels upon siRNA-mediated knock-down of OCT4 in H9 ESCs. Left: qRT-PCR of *OCT4* and *NANOG* transcript levels upon depletion of OCT4. Right: qRT-PCR of iPSC-enriched lincRNA levels upon depletion of OCT4. Transcript levels are displayed relative to non-targeting control siRNAs (ctrl siRNA) ($n=3$, error bars \pm s.e.m.). C) iPSC-enriched lincRNA expression during EB differentiation of H9 ESCs. Left: qRT-PCR analysis monitoring transcript levels of pluripotency markers (*OCT4* and *NANOG*) and the differentiation marker *LMNA* over a ten day differentiation time-course; right: qRT-PCR analysis of iPSC-enriched lincRNAs. RNA levels are depicted relative to undifferentiated cells ($n=2$, error bars \pm s.e.m.).

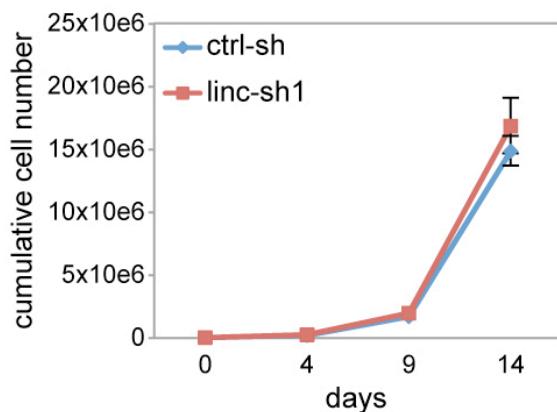

Supplementary Figure 8: Effect of lincRNA knock-down on reprogramming. A) qRT-PCR to document the efficiency of lincRNA-SFMBT2 knock-down following infection with shRNA-expressing lentivirus relative to a non-targeting control (n=4, error bar +/- s.e.m.). B) qRT-PCR shows that lincRNA-SFMBT2 and lincRNA-ST8SIA3 are not expressed in dH1f fibroblasts prior to reprogramming (n=2, error bar +/- s.e.m.). Expression values are depicted relative to the levels in H9 cells. C) Quantification of iPSC colonies derived from dH1f cells upon knock-down of lincRNA-SFMBT2 relative to a non-targeting control (n=2, error bar +/- stdv).

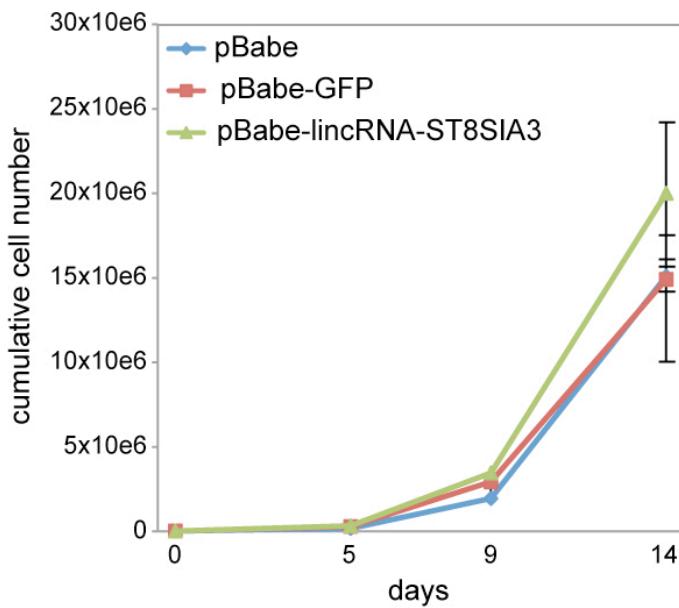

Supplementary Figure 9: Characterization of iPSCs derived from lincRNA-ST8SIA3 knock-down and overexpression reprogramming experiments. A) qRT-PCR to document the expression of reprogramming factor mRNAs; blue: total (transgenic and endogenous) levels of *OCT4*, *SOX2*, *KLF4*, and *MYC* mRNAs, red: endogenous levels of *OCT4*, *SOX2*, *KLF4*, and *MYC* mRNAs in H9 ESCs, dH1f fibroblasts, and fibroblast-derived iPSC lines derived from the non-targeting control-sh knock-down (ctrl-sh iPS1), the lincRNA-ST8SIA3 targeting knock-down (linc-sh iPS2), the control experiment with the GFP-expressing pBabe vector (pBabe-GFP iPS1), and the lincRNA-ST8SIA3 overexpression experiment (pBabe-lincRNA-ST8SIA3 iPS3). Expression levels are depicted relative to the levels in H9 ESCs (log scale). B) Top: Bright field images of iPSC colonies. Bottom: live-cell imaging of the same fibroblast-derived iPSC lines to document activation of the SSEA4 and Tra-1-60 cell surface markers. Hoechst 33342 was used as a DNA counter-stain. C) qRT-PCR to document downregulation of *OCT4* and *NANOG* mRNAs, as well as upregulation of differentiation markers *GATA4* and *AFP* (endoderm), *RUNX1* and *GATA2* (mesoderm), and *NCAM* (ectoderm) in day 6 EBs derived from ctrl-sh iPS1, linc-sh iPS2, pBabe-GFP iPS1, and pBabe-lincRNA-ST8SIA3 iPS3 cells. Expression values are represented relative to undifferentiated controls.

A

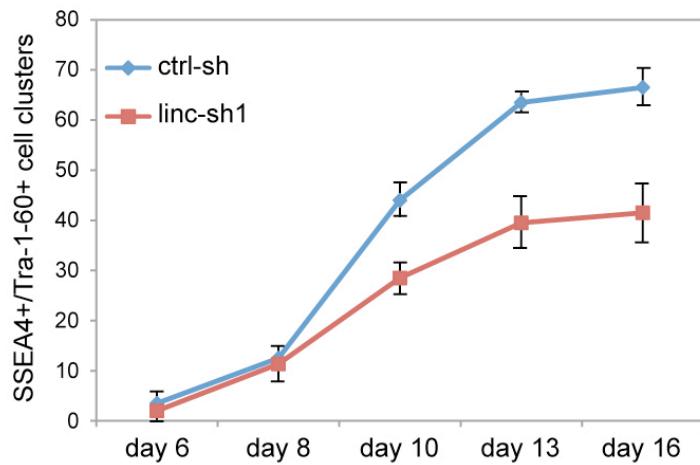

B

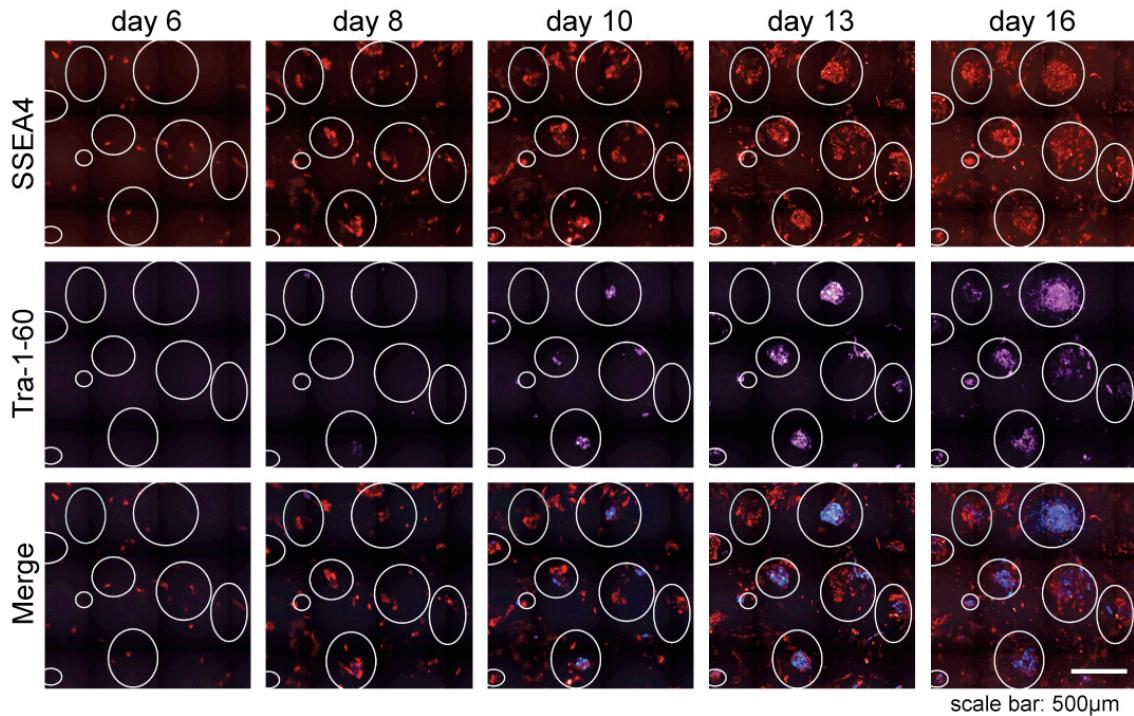

Supplementary Figure 10: Knock-down or overexpression of lincRNA-ST8SIA3 in dH1f fibroblasts does not affect cell growth. A) Cumulative cell numbers measured over a 14 day time-course after infection of dH1f with a non-targeting control-shRNA expressing virus (ctrl-sh) and a lincRNA-ST8SIA3 targeting virus (linc-sh1). No statistically significant difference in cell growth could be observed (n=4, error bars +/- s.e.m.; P=0.92). B) Cumulative cell numbers measured over a 14 day time-course after infection of dH1f with empty pBabe virus, pBabe-GFP, or lincRNA-ST8SIA3 overexpression virus (pBabe-lincRNA-ST8SIA3). No statistically significant difference in cell growth could be observed (n=2, error bars +/- s.e.m.; P=0.79 (compared with pBabe) and 0.81 (compared with pBabe-GFP)). Statistics were performed using Student's t-test.

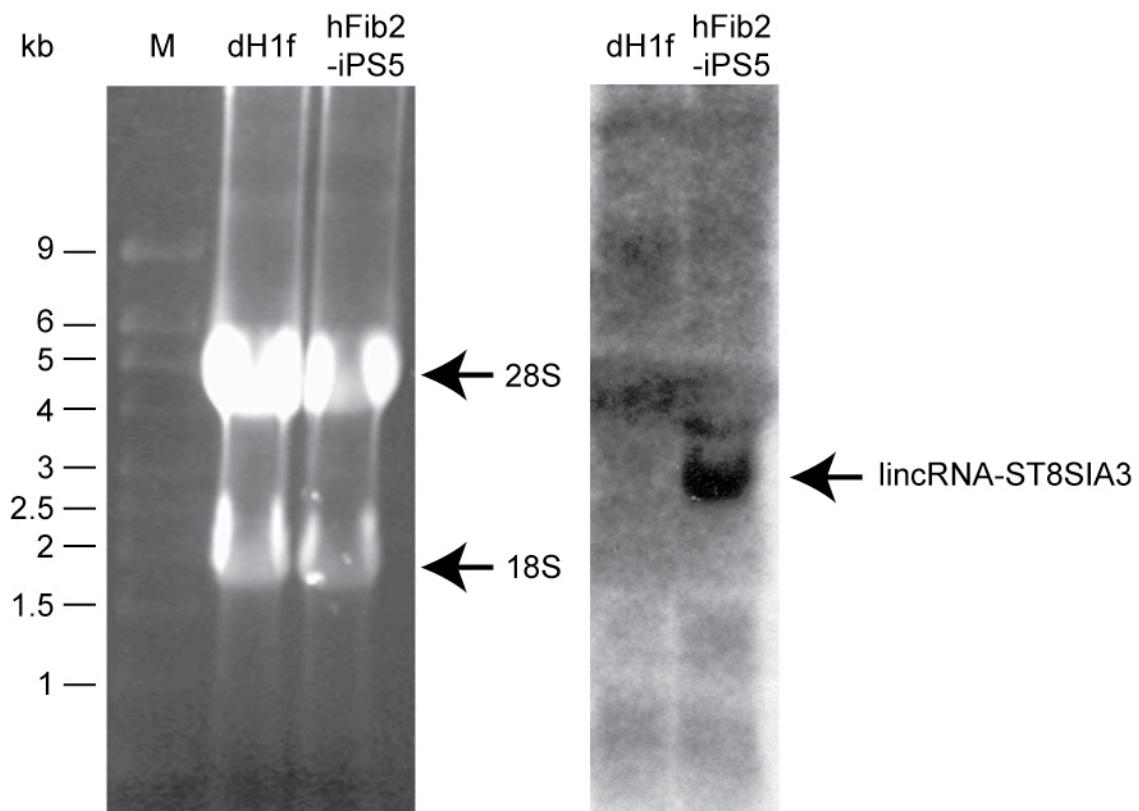

A

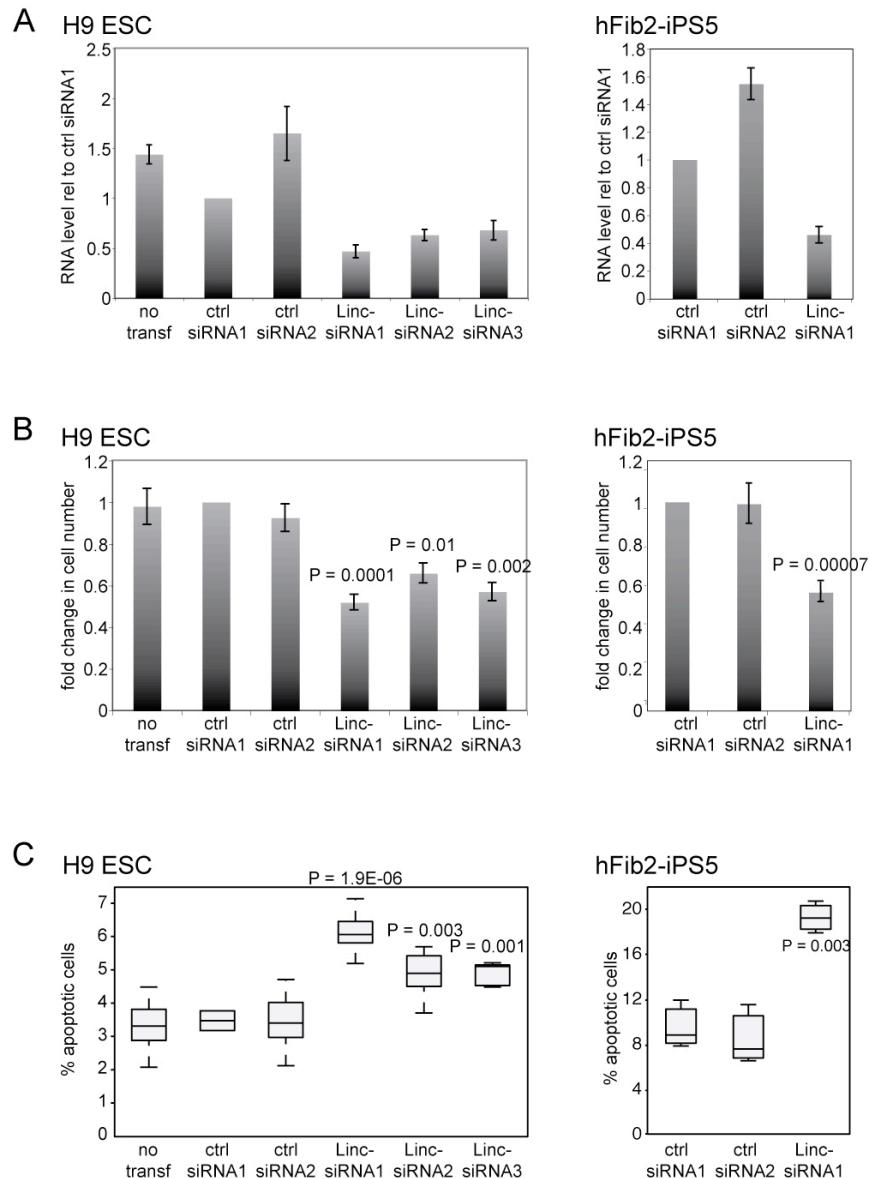

B

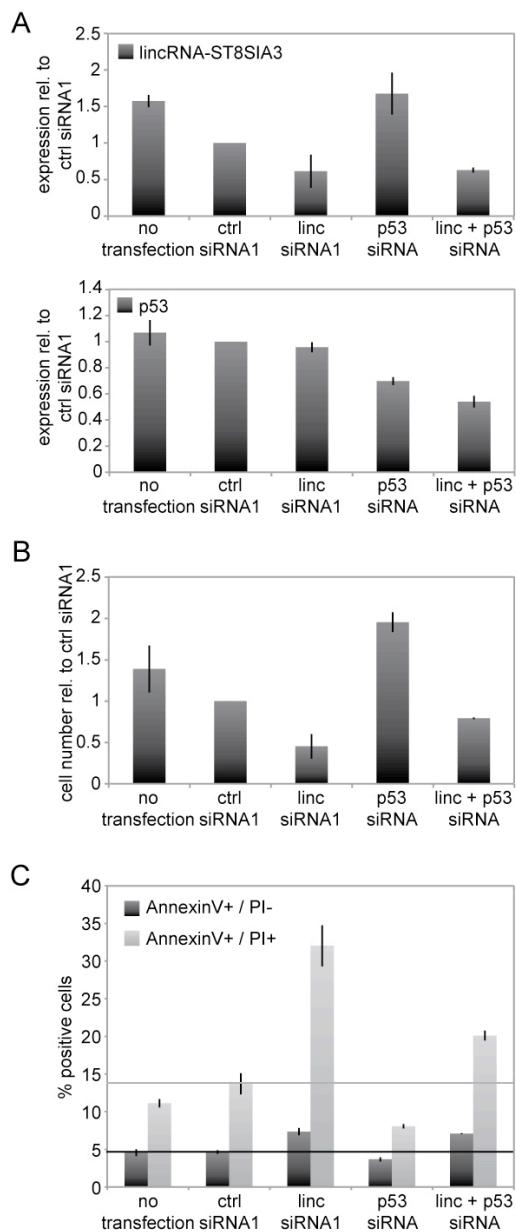

Supplementary Figure 11: Live-cell imaging to follow the kinetics of reprogramming. A) Quantification of SSEA4+/Tra-1-60+ cell clusters from day 6 to day 16 of reprogramming in the control (ctrl-sh) and lincRNA-ST8SIA3 knock-down (linc-sh1) sample. Four regions per 6well (each region with an area of 53.21mm²) were quantified for each control and linc-sh1, and average numbers of cell clusters per area are plotted on the y-axis. Error bars represent +/- stdv. B) Representative subregion of SSEA4 (red) and Tra1-60 (purple) stained reprogramming cells. White circles mark SSEA4+/Tra-1-60+ cell clusters identified on day 16.

Supplementary Figure 12: Northern Blot of lincRNA-ST8SIA3 in dH1f and hFib2-iPS5 cells detects a 2.6kb band. Left: ethidium bromide stained agarose gel to show 28S and 18S ribosomal RNA loading controls, as well as the position of RNA marker bands. Right: Blot of lincRNA-ST8SIA3 using a specific probe (see Supplementary Methods) confirms its 2.6kb length.

Supplementary Figure 13: siRNA-mediated knock-down of lincRNA-ST8SIA3 affects ESC and iPSC growth. A) qRT-PCR validation of three lincRNA-ST8SIA3-targeting siRNAs (Linc-siRNA1, -siRNA2, -siRNA3) compared with two non-targeting controls (ctrl siRNA1 and ctrl siRNA2) as well as non-transfected cells in H9 ESCs (left) and hFib2-iPS5 cells (right). RNA levels are depicted relative to the levels in cells transfected with ctrl siRNA1 ($n \geq 3$, error bar \pm s.e.m.). B) Cell growth of H9 ESCs (left) and hFib2-iPS5 cells (right) upon knock-down of lincRNA-ST8SIA3 compared to non-targeting controls as measured by total cell numbers 72h post-transfection. Cell numbers are depicted relative to the control (ctrl siRNA1). C) Percentage of early apoptotic cells ($\text{AnnexinV}^+/\text{Propidium iodide}^-$) measured by flow cytometry in non-transfected cells, cells transfected with non-targeting control siRNAs, and lincRNA-ST8SIA3-targeting siRNAs in H9 ESCs (left) and hFib2-iPS5 cells (right). Boxes represent the 25th to 75th percentiles of the data, the central line marks median values. Whiskers extend to the most extreme data points. Statistical analysis was performed using Student's t-test.

Supplementary Figure 14: siRNA-mediated knock-down of p53 partially rescues growth deficiency and elevated cell death of H9 cells caused by lincRNA-ST8SIA3 knock-down. A) qRT-PCR documents the efficiency of lincRNA-ST8SIA3 (top) and p53 (bottom) knock-down 72h after siRNA transfection. Expression values are depicted relative to the non-targeting control (ctrl siRNA 1); n=2, error bars +/-s.e.m. B) Relative cell numbers 72h post-transfection in non-transfected cells, or cells transfected with lincRNA-ST8SIA3 targeting siRNA (linc siRNA 1), p53-targeting siRNA (p53 siRNA), or both compared with control-transfected cells (ctrl siRNA 1); n=2, error bars +/-s.e.m. C) Flow cytometric analysis of early apoptotic (AnnexinV+/PI-) and late apoptotic/necrotic (AnnexinV+/PI+) cells 72h following knock-down of lincRNA-ST8SIA3, p53, or both, compared with the non-targeting control and untransfected cells; n=2, error bars +/-s.e.m.

C) siRNA and shRNA sequences

siRNAs

NAME	SEQUENCE
OCT4	AGCAGCTTGGGCTCGAGAA
Ctrl siRNA1	AllStars Negative Control siRNA (Qiagen #1027280)
Ctrl siRNA2	siGENOME Non-targeting siRNA #1 (Dharmacon #D-001210-01-05)
GAPDH control siRNA	siGENOME GAPDH Control siRNA (Dharmacon #D-001140-01)
LincRNA-ST8SIA3 siRNA1	GGAGAGGAAGCCTGAGAGT
LincRNA-ST8SIA3 siRNA2	GGTTAAAGACACAGGGGAA
LincRNA-ST8SIA3 siRNA3	CTTCAGGATAAATGAGAAA
LincRNA-ST8SIA3 siRNA 4	CCTGAGAGTTGGCATGAAT
si-p53	siGENOME SMARTpool (Dharmacon)

shRNA Constructs
