Navdanya Team:

Editors: Vandana Shiva, Caroline Lockhart.

Additional Research and Editing: Carla Ramos Cortés, Elisa Catalini, Ruchi Shroff

Translations: Elisa Catalini, Carla Ramos Cortés

Front Cover Illustration: Federico Zenoni

Layout: Elisa Catalini

Authors:

Vandana Shiva, founder of Navdanya Research Foundation for Science, Technology and Ecology (India) and President of Navdanya International.

Farida Akhter, founding Executive Director of UBINIG, Bangladesh.

Fernando Cabaleiro, Attorney at law (University of Buenos Aires), Naturaleza de Derechos, Argentina.

Community Alliance for Global Justice/AGRA Watch.

GM Watch.

Nicoletta Dentico, journalist, and director of the global health program of Society for International Development (SID).

José Esquinas Alcazar, former Secretary of the FAO Intergovernmental Commission on Genetic Resources for Food and Agriculture and Chairman of the FAO Ethics Committee for Food and Agriculture.

Seth Itzkan, Co-founder and Co-Director of Soil4Climate Inc.

Dru Jay, Coordinator of GeoengineeringMonitor.org, writer and activist in climate justice and Indigenous solidarity movements, based in Montreal, Canada.

Aidé Jiménez-Martínez, MA in Sciences, Director of Regulations of Biosafety, Biodiversity and Genetic Resources, SEMARNAT, Mexico.

Satish Kumar, Founder of Schumacher College, England, UK.

Jonathan Latham, molecular biologist and former genetic engineer. He now edits the website Independent Science News.

Mantasa, Indonesia.

Chito Medina, founding member of MASIPAG (Farmers-Scientists Partnership For Development), and former National Coordinator of the network. Associate Professor of environmental science in a leading university in the Philippines.

Zahra Mooloo, Kenya, Investigative journalist, documentary filmmaker and researcher on extractive industries, land rights, conservation and security. ETC Group, based in Montreal, Canada.

Silvia Ribeiro, Uruguay, Journalist, lecturer, writer, and educator on emerging technologies, Latin American Director, ETC Group, based in Mexico City.

Adelita San Vicente, Doctor in Agroecology, Director General of the Primary Sector and Natural Resources, SEMARNAT, Mexico.

Tapsoba Ali de Goamma; Human rights activist; Ecologist; President of the Terre A Vie association; Spokesperson for the Collectif Citoyen pour l'Agroécologie (Citizen's Collective for Agroecology).

Jim Thomas, Co-Executive Director and Researcher, focusing on emerging technologies on human rights, biodiversity, equity, and food systems, ETC Group, currently based in Canada.

Timothy Wise, Senior Advisor at the Institute for Agriculture and Trade Policy (IATP).

INTRODUCTION

**ESTABLISHING A GLOBAL EMPIRE OVER LIFE,
THROUGH MONOCULTURES, PATENTS AND MONOPOLIES
BY RUPTURING A WORLD OF DIVERSITY,
SELF ORGANIZATION AND FREEDOM**

Vandana Shiva

Agriculture is the culture of the land. Respecting and caring for the land has sustained societies over thousands of years. Diversity of agricultural systems have evolved in different ecological climates and across diverse biomes – from mountains to coastal areas, from deserts to rainforests.

Food and agricultural systems have evolved from the land in diversity, sustainability, and freedom.

Diversity and decentralization in living systems are the basis of freedom in nature and culture, in our seeds and agricultural systems, and in our food and knowledge systems.

Nature knows no monocultures. Cultures know no homogeneity and uniformity.

This was the agriculture we inherited before industrialization took hold.

Diversity, Self-Organisation and Freedom

Diversity is sustainability.

Indigenous communities have evolved the most ingenious farming systems down the ages. Some examples follow:

60,000 years ago, Australian Aborigines cultivated rice and barley, desert raisin, wild tomatoes, yams greens, cooper's clover, grass seeds, Nardoo, bogong moths and bunya nuts and created "the biggest estate or garden on Earth"¹.

Diverse indigenous peoples of the Amazon were gardeners and agroforesters, who grew crops among trees. Jennifer Watling, archaeologist at the University of São Paulo in Brazil, finds evidence of millions of inhabitants in the Amazon who carefully managed the soil and biodiversity, leaving both richer.² "It looks a lot like agroforestry — managing the landscape, encouraging palms and probably other useful plants as well..."³.

In the Andes, indigenous cultures were growing peanut, cotton, and squash all the way back 5,000-9000 years ago⁴. Andean peasants of Peru and Bolivia evolved more than 4000 varieties of potatoes, grown alongside corn, quinoa, squash, and beans⁵. The Aztecs, in 1265 AD, created floating gardens in the lakes of Chalco and Xochimilco that surrounded Tenochtitlan, the capital of the Aztec Empire⁶.

Native American Indians began farming approximately 7,000 years ago. In Mesoamerica they transformed wild teosinte into the diversity of maize/corn varieties some 6000 years ago⁷. By A.D. 1000, native American farmers had developed a complex agriculture based on three major crops—corn, beans, and squash—which led to the breeding of a host of other plants providing diversity of supplemental crops⁸.

In the Middle East, the land of the Fertile Crescent, earliest records of

farming date back to 23,000 years ago.⁹ Cereals were grown in Syria as long as 9,000 years ago, while figs were cultivated even earlier; prehistoric seedless fruits discovered in the Jordan Valley suggest fig trees were being planted some 11,300 years ago¹⁰.

In Asia agricultural systems evolved 40,000 years ago¹¹. The origins of rice and millet farming date to around 6,000 B.C.E. Indian indigenous peasants over time transformed a wild grass, *Oryza sativa*, into 200,000 rice varieties¹² and have evolved a great diversity of crops with more than 30,000 plants and cultivated more than 10,000 species¹³.

As Sir Albert Howard stated in his 'Agricultural Testament':

"What is happening today in the small fields of India and China took place many centuries ago. The agricultural practices of the Orient have passed the Supreme test - they are almost as permanent as those of the primeval forest, of the prairie or of the ocean."

Creating monopolies over seed, food and agriculture

A century of chemical, industrial agriculture has destroyed the planet's climate systems, pushed millions of species to extinction, desertified the soil and destroyed water systems.

One hundred years ago the chemicals produced by IG Farben and company (which today we know as the Poison Cartel) for use in the two world wars and concentration camps were then directed into agriculture and sold as agrichemicals. These chemicals found further fertile terrain in the 1960's when the Green Revolution was imposed on the Third World by the World Bank, the US government, and the Ford and Rockefeller Foundations, and vast areas of monocultures wiped out thousands of years of evolutionary diversity and innovation¹⁴.

Farmers seeds, evolved and bred by farmers over millennia, were gathered up and stored in newly created institutions such as the International Rice Research Institute (IRRI) in the Philippines and the International Maize and Wheat Improvement Centre (CIMMYT) in Mexico. These institutions have today grown into the CGIAR systems which Bill Gates has now taken over as "One CGIAR" to be subsumed into his newest venture "Gates AgOne" or "One Agriculture", towards controlling the world's seeds. Any attempt to try and prevent this take-over of farmers seeds to preserve their heritage has been bluntly prevented as in the case of India's most eminent scientist Dr.R.H. Richharia¹⁵.

Thus, we have today vast monocultures of the chemically responsive Green Revolution varieties of seed along with the conditionalities, credits and subsidies that come with them.

In the 1990's, the Poison Cartel, having introduced chemicals in agriculture, were quick to adopt genetic engineering as a mechanism to patent seed. They freely took and patented the farmers seeds housed in the CGIAR and other gene banks, by simply adding the toxic Bt gene or the RoundUp Resistant gene¹⁶.

Chito Medina, a leader in the struggle of peasants' for Seed Sovereignty, Food Sovereignty and Knowledge Sovereignty in the Philippines outlines in his article how people's movements are demanding the shutting down of the CGIAR institutions such as the IRRI.

Monocultures of GMO corn, soya, cotton, and canola have spread over millions of acres. Monocultures intensified as did the use of toxic chemicals. Agriculture became decoupled from food, and crops were reduced to commodities to be used primarily as biofuel and animal feed.

Movements for Seed Freedom and Food Freedom against a globalised industrial agriculture grew stronger.¹⁷ Civil society marches against Monsanto and the Tribunal and People's Assemblies¹⁸ against Monsanto widely made known the multinational's relentless and innumerable toxic transgressions and violations- until its long time MoBay partner¹⁹ and pharmaceutical giant, Bayer, bought it up, thus conveniently taking it out of the public eye.

Long experience and research have shown that Agroecology based on Biodiversity, Seed Freedom and Food Freedom is essential to the future of food and farming²⁰.

The UN IAASTD seminal report showed that neither the Green Revolution nor GMOS could feed the world and at the same time protect the planet²¹.

Nonetheless, blind to the thousands of years of farmers' innovation and the biodiversity they had evolved, and dismissive of the voice of scientists and farmers, Gates continues with his vision of building an Agriculture Empire. Notwithstanding the scientific evidence of the failure of the Green Revolution, in 2006 he founded, along with the Rockefeller Foundation, AGRA, the Alliance for a Green Revolution in Africa.

Tim Wise's contribution on AGRA in this report assesses the failure of this 'so called' green revolution' in Africa, which had already failed and caused more negative consequences in Asia, Latin America and the US.

To quote Einstein "A clear sign of insanity is doing the same thing over and over again expecting a different outcome".

Mounting evidence shows that industrially grown and industrially processed foods contribute significantly to the chronic disease epidemic, we are now witnessing everywhere²². But the issue of the industrial agriculture system's impact on health is not one which Gates is particularly concerned with.

Twenty years ago, the Cartagena Protocol on Biosafety was established to regulate GMOS in the interests of safety of the environment and public health. Golden Rice was one of many GMO propaganda myths the biotech Poison Cartel attempted to promote (See 'Promoting Failed GMOs', Section IV).

GMOs have a history of failure as with the first generation of genetically modified Bt Cotton²³ and Roundup Ready crops²⁴. In 2011 India introduced a moratorium on genetically modified Bt Brinjal which Gates then took to Bangladesh. Farida Akhtar gives us the real story in Section IV.

Despite these warnings, Gates leads the way in the next step in disrupting our body's metabolic systems and the symbiosis in the gut microbiome with his funding of industrially processed laboratory fake food - starting with his lab-made "breast milk" and "Impossible Burger". Lab processed fake food is really about taking patents on our food, not about feeding people, as Gates and his fellow biotech friends would like us to think.

Since 2015, Gates has been swiftly expanding his Empire over Seed, Agriculture and Food, engaging in and funding large scale biopiracy (see articles on the biopiracy of banana and climate resilient seeds in Section II).

²⁴ Union of Concerned Scientists. (2013). *The rise of superweeds—And what to do about it*. <https://www.ucsusa.org/resources/rise-superweeds>

Through digital technologies, he is voraciously mapping, patenting and pirating seeds from around the world, ignoring and eroding all International government Treaties on the protection of biodiversity. And so, he continues to subvert and sabotage both farmers' seed sovereignty and the seed sovereignty of countries.

Aidé Jiménez-Martínez and Adelita San Vicente write about the undermining of the Nagoya protocol under the Convention on Biological Diversity through digital genome mapping. José 'Pepe' Esquinas Alcazar, the eminent main 'Seed man' at FAO for decades and the architect of the FAO Seed Treaty, draws our attention to how digital genome sequencing is subverting the sovereignty built into UN agreements.

False claims of precision and safety were made at the time for the first generation of GMOS, and today are again being made about gene editing technology.

Jonathan Latham's article 'God's Red Pencil'²⁵ shows how gene editing is by no means a precise "cut" and "paste" technology. It is scrambling the evolving tree of life and has unexpected and as yet unknown effects on organisms.

The European Court of Justice has ruled that gene edited organisms are GMOs. However, Gates is hastily pushing for deregulation with no regard for caution or potentially dangerous consequences. His "Gates AgOne" initiative has declared that time, essential to be able to assess and implement safety, is the enemy. He is rushing to impose untested seeds, foods, medicines on humanity, undermining all scientific and safety assessments, and destroying safe alternatives that have existed over thousands of years. Gates has no compunction in endangering life and people's health in his pursuit of power and riches.

"Gates Ag One" is a clear declaration of his intent to create an Empire over life and biodiversity, over food and farming, and over our daily bread.

As one humanity we cannot allow and must prevent this Empire over life which builds on and reinforces the Poison Cartel's century of ecocide and genocide and is pushing us faster down the road towards extinction.

Choosing the path of diversity and life, as opposed to the violent path of monocultures and destruction is our duty to the Earth and future generations.

At stake is not only the biological and cultural diversity of the world, our seed freedom and food freedom, but our health and democracy, our life, our freedom.

Our very future as a species.

SECTION 1

ONE EMPIRE OVER SEED, BIODIVERSITY AND KNOWLEDGE

Source: "Global Seed Industry Changes Since 2013." Philip H. Howard, December 31, 2018. <https://philhoward.net/2018/12/31/global-seed-industry-changes-since-2013/>

ONE EMPIRE OVER SEED: CONTROL OVER THE WORLD'S SEED BANKS

Vandana Shiva

Since the onset of the Neolithic Revolution some 10,000 years ago, farmers and communities have worked to improve yield, taste, nutritional and other qualities of seeds. They have expanded and passed on knowledge about health impacts and healing properties of plants as well as about the peculiar growing habits of plants and interaction with other plants and animals, soil and water. The free exchange of seed among farmers has been the basis to maintaining biodiversity and food security.

A great seed and biodiversity piracy is underway, not just by corporations — which through mergers are becoming fewer and larger— but also by super rich billionaires whose wealth and power open doors to their every whim. Leading the way is Microsoft mogul, Bill Gates.

When the Green Revolution was brought into India and Mexico, farmers' seeds were “rounded-up” from their fields and locked in international institutions, to be used to breed green revolution varieties engineered to respond to chemical inputs¹.

The International Rice Research Institute (IRRI) in the Philippines and the International Maize and Wheat Improvement Centre (CIMMYT), were the first to

¹ Shiva, V. (1991). *The Violence of the Green Revolution: Third World Agriculture, Ecology, and Politics*. Other India Press. <https://books.google.it/books?id=jPNRPgAACAAJ>

roundup the diversity from farmers' fields and replace it with chemical monocultures of rice, wheat, and corn. Others quickly followed.

This hijacking of farmers' seeds is best highlighted with the shameful removal of India's pre-eminent rice research scientist Dr. R.H. Richaria, as the head of India's Central Rice Research Institute (CRRI) in Cuttack, Orissa, which housed the largest collection of rice diversity in the world, for refusing to allow the IRRI in the Philippines to pirate the collection out of India. With his removal at the behest of the World Bank, Indian peasant intellectual property was hijacked to the IRRI in the Philippines which later became part of the newly created Consultative Group of International Agriculture Research (CGIAR)².

Farmers' seed heritage was held in the private seed banks of CGIAR, a consortium of 15 international agricultural research centers, controlled by the World Bank, the Rockefeller and Ford Foundations, as well as of course the Bill and Melinda Gates Foundation (BMGF), which since 2003, has poured more than \$720 million into the CGIAR centres. CGIAR gene banks presently manage 768,576 accessions of farmer' seeds. Taken together, CGIAR gene banks represent the largest and most widely used collections of crop diversity in the world.³

Principal Funders and main funding channels in 2017

<https://www.vijayvaani.com/ArticleDisplay.aspx?aid=2137>

³ "CGIAR Genebank Platform." CGIAR. <https://www.cgiar.org/the-genebank-platform/>

The Bill & Melinda Gates Foundation operates a bit like the World Bank, using its financial power and prowess to take control of agriculture and influence government and institutional agricultural policies. By far the largest funder of the CGIAR, Gates has successfully accelerated the transfer of research and seeds from scientific research institutions to commodity-based corporations, centralizing and facilitating the pirating of intellectual property and seed monopolies through intellectual property laws and seed regulations.

The urgency with which this restructuring of CGIAR and centralization of control is being done is reflected in the IPES Food open letter of 21 July 2020 as follows: *"The process now underway to reform the CGIAR is therefore imperative and of major public interest. The 'One CGIAR' process seeks to merge the CGIAR's 15 legally independent but cooperating centres, headquartered in 15 countries, into one legal entity. The impetus has come from some of its biggest funders, notably the Bill and Melinda Gates Foundation, the World Bank, and the US and UK governments."*⁴

The aim of "One CGIAR", overseen by "One CGIAR Common Board" is to merge it to become part of "One Agriculture", aka "Gates Ag One" – Gates' latest move in controlling the world's seed supply⁵. Gates has indicated he will more than double the CGIAR present budget, from \$850 million to \$2 billion a year.

Despite the long-recognized failure of the Green Revolution in India and Mexico, in 2006 Gates launched AGRA, the Alliance for a Green Revolution in Africa. The folly of imposing this failed technology in Africa is well documented in the two following articles by Nicoletta Dentico and Tim Wise.

The Seed Freedom movement has been calling for the CGIAR gene banks to return these stolen farmers varieties back to the farmers. The lessons of the Green Revolution since the 1960's have shown us that the chemical path of monocultures has undermined Earth's capacity to support life and food production by destroying biodiversity, soil and water⁶ ⁷, as well as contributing to climate change⁸. It has dispossessed small farmers through debt for external inputs. And it has undermined food and nutritional security⁹. The experience of the last half century has made clear that Seed Sovereignty, Food Sovereignty and Knowledge Sovereignty is the only viable future of food and farming.

Besides taking control of the seeds of farmers in the CGIAR seed banks, Gates (along with the Rockefeller Foundation) is investing heavily in collecting seeds from across the world and storing them in the Svalbard Global Seed Vault in the Arctic archipelago – aka the Doomsday Vault - created to collect and hold a global collection of the world's seeds. It is in association with the Consultative Group on International Agricultural Research (CGIAR) and the Crop Trust¹⁰.

The Crop Trust, based in Germany, funds and coordinates the Svalbard Seed Vault. In addition to the Bill and Melinda Gates Foundation, its funders include the Poison Cartel adherents CropLife Dupont/ Pioneer Hi-bred, KWS SAAT AG, and Syngent AG.

The largest numbers of accessions stored in the Seed Vault are varieties of rice, wheat, and barley crops; more than 150,000 samples of wheat and rice, and close to 80,000 samples of Barley. Other well represented crops are sorghum, phaseolus bean species, maize, cowpea, soybean, kikuyu grass and chickpea.

Crops such as potatoes, peanuts, cajanus beans, oats and rye, alfalfa, the cereal hybrid Triticosecale and Brassica's are represented by between 10,000 and 20,000 seed samples.¹¹

Source: 'Our Donors'. Crop Trust, <https://www.croptrust.org/about-us/donors/>.

It should come as no surprise that Gates is also funding Diversity Seek (DivSeek), a global project launched in 2015 to map the genetic data of the peasant diversity of seeds held in gene banks to then take patents on these seeds through genomic mapping¹². Seven million crop accessions are in public seed banks.

Biopiracy is carried out through the convergence of information technology and biotechnology where patents are taken on seeds through “mapping” their genomes and genome sequences.

While living seed needs to evolve “in situ”, patents on seed genomes can be taken from seed “ex situ. DivSeek is designed to “mine” and extract the data in the seed to “censor” out the commons. In effect it robs the peasants of their seeds and knowledge, it robs the seed of its integrity and diversity, it erases evolutionary history and the seed’s link to the soil, reducing it to a simple “code”. This ‘genetic colonialism’ is an enclosure of the genetic commons¹³.

The participating institutions in DivSeek are the CGIAR nodes and ‘public’ universities like Cornell and Iowa State, which are being increasingly privatized by the biotechnology industry as well as the Gates Foundation. BMGF funds Cornell’s Alliance for Science, the corporate worlds’ pseudo-science propaganda outlet while Iowa State is the institution promoting the unethical human feeding trials of GMO bananas. Other Gates-funded DivSeek partners are the African Agricultural Technology Foundation and Africa-Brazil Agricultural Innovation Marketplace developed by the Brazilian Agricultural Research Corporation (Embrapa)¹⁴.

Through a new ‘front’ corporation, Editas Medicine¹⁵, BMGF is investing in a one-year-old experimental genetic engineering tool for gene editing, CRISPR-Cas9. Though the technology itself is immature and inaccurate, it has become a gold rush for new patents. The language of “gene editing” and “educated guesses” is creeping into scientific discourse.

Piracy of common genomic data of millions of plants bred by peasants is termed “big data”. Big data however is not knowledge, it is not even information. It is ‘privateered’ data, pirated and privatised.

Seeds are not just germplasm. They are living, self-organizing entities, subjects of evolution, history, culture, and relationships.

In the 1980s, Monsanto led the push for GMOs and patents on seed and life. Today the flag bearer is Bill Gates. In a nutshell: one billionaire given free access to use his wealth to bypass all international treaties and multilateral governance structures to help global corporations highjack the biodiversity and wealth of peasants by financing unscientific and undemocratic processes such as DivSeek, and to unleash untested technologies such as the CRISPR technology on humanity.

Over the last two decades, thousands of concerned citizens and organizations have taken action and written laws to protect the biodiversity of the planet and the rights of farmers to seed, and the rights of consumers to safety, among them, the Convention on Biological Diversity (CBD); the Cartagena Biosafety Protocol to the CBD; and the International Treaty on Plant Genetic Resources Treaty for Food and Agriculture (ITPGRFA).

Contributors to this report outline how Bill Gates and his foundation routinely undermine international treaties created to protect biodiversity, farmers rights, and the sovereignty of countries and communities of their seed and biodiversity wealth.

BMG FOUNDATION AND IRRI: CORPORATE HIJACK OF RICE SCIENCE

Chito P. Medina

The Bill and Melinda Gates Foundation (BMGF)

Bill Gates is one of the richest people on earth who has established the world's largest philanthropic organization, the Bill and Melinda Gates Foundation (BMGF). Organized in 2000, BMGF was reported to have total assets of \$46.8 billion (as of 2018). It has become the world's largest donor, and with it the most influential, in international development particularly in global health and agriculture policy, research, and programs. In fact, its influence in agricultural development is far greater than most countries.

BMGF is the biggest private charitable donor to the CGIAR system, and third overall (after the US and UK) contributing 13 percent of total budget (2014 CGIAR Annual Report). In recognition of its huge contribution, BMGF is the only private/non-governmental voting member in the CGIAR System Council. Over a period of 15 years, BMGF's direct grants to IRRI averaged US\$ 10.3M/yr which amounts to 15 percent of IRRI's annual budget (IRRI audited 2016 financial statement). Out of all of IRRI's bilateral and restricted research funds for 2016, BMGF grants of US\$11.716M constitute 18 percent.

The generous philanthropic contributions of BMGF towards alleviating poverty and hunger would be welcomed except that such contributions carry their own agenda. It attempts to bring simplistic solutions based on science and technology to address the complex problems of hunger and poverty. Such high-end science and technology are, in fact, more aligned to corporate interests rather than the contexts and needs of poor farmers. Importantly, BMGF lacks transparency and accountability. The philanthropic foundation is only accountable to its three trustees, Bill Gates, Melinda Gates and Warren Buffet.

This paper analyzes the grants of BMGF to the Consultative Group on International Agricultural Research (CGIAR), focusing on one of its research centers, the International Rice Research Institute (IRRI).

The International Rice Research Institute (IRRI)

The International Rice Research Institute (IRRI) was established in the Philippines on April 4, 1960 by the Rockefeller Foundation and Ford Foundation "to feed the world" within a Malthusian framing. Its signature program was called the 'Green Revolution' (GR) in rice. Implicit in the name of the program, it is alluded to as an alternative in order to contain the spreading red revolution/communism of those years.

IRRI's GR in rice is actually composed of a package of technology centered on 'high yielding variety' seeds, under conditions of high fossil energy-based inputs (fertilizers, pesticides, machinery), irrigation, and production loans. It was successful in converting rural peasant farming into the capitalist market economy. This helped pave the way for globalization and corporate control of agriculture and food systems.

In a broader picture, similar international research centers on agriculture, forestry, and fishery were established, and in 1971, the Consultative Group on International Agricultural Research (CGIAR) was formed to serve as a coordinating body through which funds for international agricultural research could be administered to its 15 research centers. Being the biggest private donor to CGIAR, Bill Gates now sits in the CGIAR Fund Council. The Chair of CGIAR is a senior vice president of the World Bank.

IRRI, as an international research organization, appears to be public—hence it projects as an unquestioned public interest institution, but it is not. IRRI is a not for profit organization. Research donors are governments, foundations, and business corporations. It has tremendous power to influence the direction of agricultural research, but it lacks public accountability. In fact, IRRI in the Philippines is protected by law (Presidential Decree 1620) and is immune/not accountable to any adverse effects of its research and technology.

"Golden Rice grain compared to white rice grain in greenhouse of Golden Rice plants", by International Rice Research Institute (IRRI) is licensed under CC BY 2.0 (<https://creativecommons.org/licenses/by/2.0/>).

Who determines IRRI's Agenda? Gone were the days when science is unquestionably for the public good. IRRI is always on the path of 'modernization' of agriculture which is unmistakably industrial farming. Its agenda is guided by corporate values, influenced by corporate representatives, and often determined by its funding sources. In fact, there is a funding mechanism (Window 3 funds) wherein the donor designates to individual research centers for specific purposes. It used to be called **commissioned research**, but perhaps realizing the very private image of the term, they now call it **bilateral restricted funding**. This means that the funds provided by the donor are for predetermined, specific activities and outputs. Often, any commercializable results are reserved for the funding donor.

BMGF funding to CGIAR and IRRI

Over a span of 13 years (2008-2020), BMGF has granted a total of US\$1.136 Billion funding to 12 CGIAR research centers and the CGIAR system organization (Table 1). In fact, it contributes 13 percent of its entire budget. As mentioned above, BMGF is the third largest donor (next to US and UK) and the largest private donor.

From 2008 to 2020, BMGF has funded 15 projects of IRRI for a total of US\$ 154,544,972 (Table 2). Over the years, the foundation has been contributing an average of 15 percent of IRRI's budget per year. On a yearly basis, BMGF contributed 18 percent of all research grants in 2016 (IRRI 2016 Audited Financial Statements), and 64 percent of all the Bilateral Restricted research grants in the same year.

Table 1. Project grants funded by Bill and Melinda Gates Foundation to the CGIAR and its research centers (2008-2020).

Extracted from <https://www.gatesfoundation.org/How-We-Work/Quick-Links/Grants-Database/Grants> (accessed June 8, 2020)

There are at least five big research projects funded by BMGF in IRRI.

- The first was the 'Realizing Increased Photosynthetic Efficiency' (RIPE) program that started in 2008 and lasted for seven years where BMGF contributed US\$19.4 M. It was touted as an innovative scientific research program attempting to make rice, a C3 plant, into a C4 plant in order to make it more efficient in photosynthesis for higher grain production, through genetic engineering. A C4 super rice was projected to produce 50% more yield and significantly contribute to global food security. To date, except for some knowledge gained, there is no tangible C4 super rice produced.
- The second IRRI project funded by BMGF is genetically engineered golden rice. The first phase lasted from 2010 to 2017 with a total grant of more than US\$ 10M, and the second phase from 2017 to 2022 with a total grant of US\$ 18 M. It aims to be able to reach the approved commercial stage in Bangladesh and in the Philippines, by then. Despite strong people's opposition, this overwhelming funding to push golden rice is too big to reckon with in the fight against this GMO.
- Third is the Stress Tolerant Rice for Africa and South Asia (STRASA) project focusing on development of seed systems tolerant to drought, submergence, salinity, iron toxicity, cold, and biotic stress. The first and second phases were implemented from 2007 to 2010 and 2011 to 2014 with US\$ 20 M for each phase, and a third phase from 2014 to 2019 with a budget of US\$ 32.77M. Perhaps the most publicized output is Swarna-Sub1 rice or scuba rice. The gene used here came from naturally occurring local Indian rice variety Swarna, and bred to modern varieties using marker assisted selection.
- Fourth is Transforming Rice Breeding (TRB) which was implemented from 2013 to 2018 with a budget of US\$12.5 M. It focused on rice germplasm development and networking of trial and testing of newly developed varieties.
- Fifth, Accelerated Genetic Gain in Rice in South Asia and Africa (AGGRi) Alliance was organized from the merger of STRASA and TRB with a new funding of US\$34.99B from BMGF. It aims to modernize and unify existing rice breeding efforts and strengthen its partnership with the National Agricultural Research and Extension System (NARES) to increase rice yield and improve livelihood of rice farmers in South Asia and Africa.

Another significant BMGF supported program where IRRI is involved (IFPRI and CIAT are the project holders) is Harvest Plus otherwise referred to as Challenge Program. This program started in the early 1990s, but BMGF started supporting it in 2003. It is a very big alliance of nine CGIAR research centers, universities, private sector, NGOs, and other international/national agricultural research institutes. This program aims to develop crops to provide higher levels of micronutrients such as iron, zinc, and vitamin A through biofortification. Rice biofortification is done through conventional breeding (high zinc rice), transgenic biofortification (Golden rice) and gene editing biofortification (high zinc rice).

In its networking mechanism, IRRI is the convenor and secretariat for the Global Rice Science Partnerships (GRiSP) which are also indirectly supported by BMGF through other programs. This influences and unifies all research activities on rice science.

Lastly, IRRI is the secretariat of the Hybrid Rice Research and Development Consortium (HRRDC) organized in 2007. HRRDC laid down the foundation for a direct relationship between IRRI and private seed companies, with the former providing parent lines to the latter. GRiSP, AGGRi Alliance and HRRDC are big networks for the consolidation, diffusion, and with it, influence on rice research, development, and farming.

Table 2. BMG Foundation Funding Granted to IRRI from 2008 to 2019.

| YEAR | AMOUNT(US\$) | PURPOSE OF PROJECT |
|--|--------------|---|
| RIPE Program (Realizing Increased Photosynthetic Efficiency) | | |
| 2008 (to 2012) | 11,017,675 | to increase yield by increase the photosynthetic efficiency of rice (44) |
| 2012 (to 2016) | 8,375,747 | to increase yield by increasing the photosynthetic efficiency of rice (43) |
| Golden Rice Project | | |
| 2010 (to 2017) | 10,287,784 | to address the problem of Vitamin A deficiency among millions of people in the Philippines and Bangladesh (83) |
| 2017 (to 2022) | 18,000,000 | to develop and deploy healthier rice varieties genetically engineered to improve the nutritional and health status of the poor in Asia, particularly in Bangladesh and the Philippines (63) |
| STRASA (Stress Tolerant Rice For Africa and South Asia Project) | | |
| 2011 (to 2014) | 20,000,000 | to develop and disseminate stress-tolerant rice varieties for smallholder farmers in Africa and South Asia. (37) |
| 2014 (to 2019) | 32,770,000 | to reduce poverty and hunger and increase food and income security for farm families and rice consumers in South Asia and sub-Saharan Africa through the development and dissemination of high-yielding rice varieties tolerant of abiotic stresses (61) |
| TRB Project (Transforming Rice Breeding) | | |
| 2013 (to 2018) | 12,500,000 | to significantly increase the efficiency and genetic gain in irrigated rice breeding programs by using modern breeding tools and approaches to increase food and income security of resource-poor farmers, and to ensure rice food security in Asia and Africa (61) |
| AGGri Alliance (Accelerated Genetic Gain in Rice in South Asia and Africa), merged TRB and STRASA | | |
| 2018 (to 2023) | 34,990,000 | to unify existing rice breeding efforts targeting South Asia and Sub-Saharan Africa into a system capable of sustainably delivering genetic gain in farmers' fields (60) |
| Other Project Grants | | |
| 2008 | 22,128.658 | to decrease hunger and poverty in South Asia by increasing rice, wheat and maize production (43) |
| 2009 | 96,869 | to support the Conference in Beijing, China in connection with the IAAE conference (30) |
| 2010 | 600,000 | to monitor the diffusion of improved crop varieties in rainfed areas of South Asia (40) |
| 2013 | 690,327 | to conduct pilot survey to monitor varietal adoption and rice production in South Asia (12) |

| | | |
|------|-----------|---|
| 2014 | 3,359,914 | to increase rice productivity in South Asia and improve agricultural policies (54) |
| 2016 | 880,000 | to help Indian and Bangladeshi rice breeding programs deliver higher rates of genetic gains in the farmers' fields by improving product design, shorten breeding cycles, increase selection pressure, and improve heritability (50) |
| 2019 | 954,527 | to evaluate the effectiveness of the organization and identify potential improvements in strategy, management, and partnership that could enhance the rate of genetic gain delivered to smallholder farmers (16) |

Extracted from <https://www.gatesfoundation.org/How-We-Work/Quick-Links/Grants-Database/Grants> (accessed June 15, 2020)

Outcome of IRRI Science

The introduction of IRRI's modern rice varieties through the Green Revolution has caused genetic erosion wherein a majority of local rice varieties in rice growing countries have disappeared. In Indonesia, some 1,500 traditional rice varieties and landraces disappeared between 1975 and 1990; in India, some 30,000 rice varieties is down to just 10 varieties in 75% of its rice (Ryan, 1992); 99% of rice fields in Pakistan were planted with only four High Yielding Varieties (HYV) (IRRI World Rice Statistics, 2004); and at least 85% of the rice fields in Burma, Indonesia, Philippines, and Thailand are occupied by HYVs (WRI, UNEP and IUCN, 2002). The associated biodiversity in rice fields were also displaced due to monocultures. Edible fish, snails, crustaceans, and plants were killed by pesticides. Due to intensive planting and reliance on synthetic fertilizers, soil nutrient imbalance and depletion became prevalent. Pests and diseases had periodic outbreaks due to high nitrogen levels, overuse of pesticides, and crop management practices. Water, soil, biodiversity, and humans were poisoned by pesticide residues. The expensive inputs of seeds, fertilizers, and pesticides became an economic burden to farmers and many became bankrupt. The pervasive modern rice technology developed in IRRI, supported by aggressive government extension work, made farmers 'forget how to grow rice'.

IRRI is a tool for privatizing farmers' seeds. They have collected 132,442 rice accessions from farmers and stored them in their gene bank, with a duplicate in the Svalbard seed vault in Norway. They value farmers' rice varieties, only because of their genetic diversity but they never acknowledge the associated farmers' knowledge, and the seed diversity that farmers developed is neither officially recognized nor honored. Instead, IRRI, in partnership with Diversity Seek are doing genome sequence mapping of the seeds in the 'public seed banks' and taking patents. By genetic characterization, IRRI and DivSeek are dematerializing the farmers' seeds and committing biopiracy of seed commons because they are dealing with the non-material dimensions (gene sequence) of the farmers' seeds.

Rice science in IRRI is now biased towards technologies that are covered by Intellectual Property Rights (IPR), particularly in breeding, genetic engineering, gene editing, and towards synthetic biology. For example, genetically engineered Vitamin A rice; gene editing for zinc enhanced rice; Phosphorus starvation tolerance gene (PSTOL1) to solve phosphorus deficiency; looking for rice gene to reduce methane emission and many more. These are cutting edge science but there are so many practical, ecological, cost-effective, and affordable

alternatives. These approaches are in fact aligned with corporate interests of commodified seed products, and conversely, farmers' loss of seed control, undermining localized, practical, safe, sustainable, affordable approaches.

IRRI's solution to climate change is through exploitation of genetic resources mainly through biotechnological approaches. This approach creates uniform genetic makeup rather than diversification in breeds and varieties, species and management approaches. As such, this is not reliable in an unpredictable climate change.

Restricted research can be assumed to be beneficial to IRRI because it adds to their research fund portfolio. However, it might be turning into the opposite/having an opposite effect. It is the research fund donors that benefit because they are in effect being subsidized by IRRI through its existing resources such as salaries of researchers in plantilla position, laboratory equipment, and use of other existing facilities. In some of the restricted or commissioned research, any commercializable results are reserved for the funder.

BMGF as tool for corporate hijack of rice science

With the huge funding granted for agricultural research to produce modern science and technology in order to address hunger and poverty, one is tempted to praise Mr. Bill Gates for his humanitarian character. However, there are serious concerns beneath the veneer of his philanthropy. His big actions have a particular narrative or framing that is inconsistent with the root causes of hunger and poverty. His narrative of a Malthusian framework and solutions can emanate purely from technical and scientific developments. Poverty and malnutrition actually is more complex than that, and it is the structures that perpetuate these problems that need to be fixed. Often, poverty is brought about by precarious assets and livelihood, discriminating social relations, lack of security, disempowerment, and lack of democracy. To fix such socio-political problems with expensive technological fixes will not work, no matter how sincere the philanthropic donor might be. It only aggravates and perpetuates the problem it is intending to solve.

Supporting modern farming with the use of chemical fertilizers and pesticides will only create more environmental and socio-economic and health problems as shown by the outcome of the first Green Revolution. Even if there will be successes in chemical farming or industrial agriculture, such would be ephemeral because they are not sustainable. Other than productivity, Mr. Gates is missing equity (intragenerational justice) and sustainability (intergenerational justice) which are equally important in rural development.

Mr. Gates' strong push for GMOs and its modern versions of gene editing and synthetic biology creates more serious and intense problems. Health problems associated with exposure to GMOs had been elucidated in scientific literature, yet proponents like Mr. Gates deny the problems. Contamination of biodiversity and the environment had been reported in scientific literature, but the proponents refuse to open their eyes. Unreliability of the genetic mutilation processes had been reported yet proponents refuse to listen. And so, people wonder why? This is because GMOs are patented, and it would be advantageous to the biotech seed and agrochemical companies. Corporate interest in GMOs is undeniable, and with the full support of Mr. Gates for GMOs, he is inevitably promoting corporate interests.

With funding in agricultural research, BMGF and IRRI (and CGIAR) easily influence and co-opt the National Agricultural Research and Extension System (NARES) of governments through the IRRI network, through advice, staff training, seed distribution and technology. For example, the Global Rice Science Partnership (GRiSP), another program collaboration of IRRI, lists 302 NARES partners. This means that national research and extension institutions are harmonized and homogenized, all in framing, focus and approaches, thereby setting aside other approaches which are more sustainable, and equitable. For example, organic approaches to farming, agroecology, permaculture, etc. would be labeled as second-class science because it does not conform to the cutting-edge science of Mr. Gates. With such homogenization of approaches, any unforeseen or unintended results would be more catastrophic.

Bill Gates, through his BMGF Foundation has hijacked agricultural science in rice into a corporate science. First, it focuses on the very expensive cutting-edge science of genomics, gene editing and synthetic biology that can't be afforded by most NARES in many countries. Second, the resulting technology (seeds) are covered by intellectual property rights (IPR) which can be turned to a business entity for corporate benefits. Farmers buy the seeds at exorbitant prices, making the farmers poorer while the corporations accumulate huge wealth. If the cycle goes on, this creates corporate philanthropy.

Corporate power has extended so well in science that any finding against the interest of corporations can be suppressed by interested parties. There have been uncovered situations where corporations hire scientists to make biased research to counteract any damaging independent science to their business. They can simply turn down publication of research results inimical to the interest of corporate business.

Chito P. Medina at Food, Farming, Freedom Conference 2019

Currently, no assessments have been done into whether the intentions of BMGF are indeed successfully achieved. Generosity does not automatically make positive results and success on societal objectives. Because of the potential magnitude of impacts of BMGF philanthropic funding on research and policies, there is a need for transparency and accountability and mechanisms of assessments.

Conclusion

The generous philanthropy of BMGF is actually more generous to corporate interests than the poor and hungry. It pursues industrial and chemical farming which are expensive and unsustainable. One thing is sure, the science and technology emanating from the BMGF's support makes biotech, agrochemical corporations and agribusiness control agriculture and food. It is corporate philanthropy.

OWNING SEEDS THROUGH PATENTS AND NEW GENE EDITING GMO TECHNOLOGIES

Vandana Shiva

We are witnessing today an acceleration of technological revolutions in all fields and concentration of economic power in the hands of a small number of super wealthy individuals and organizations and competing forces throwing all caution to the winds in their haste for unfettered profits and power.

Such is the case with gene editing.

Bill Gates is a big player in both promoting the old failed GMOs, including the GMO banana, Golden Rice and Bt Eggplant, as well as new GMOs based on gene editing and gene drives¹

Life is self-organised creative complexity.

Living organisms are complex self-organizing evolving systems. When genes are added, edited, or removed through genetic engineering, the self-organizing capacity of living systems is disrupted. But the self-organizing organism will nonetheless continue to evolve. How it will evolve is unpredictable and unknown.

To impose a mechanical, reductionist paradigm on evolving, living systems creates new hazards and unpredictable consequences as evidenced in the widespread failure of the first generation of GMOs.

Gates mechanistic view of life likens it to a Microsoft programme, and cutting and pasting living organisms is simply the next step in patenting and owning the next commodity.

As is typical in our times of post truth, Gates and the biotechnology industry are pushing a new technological tool, gene editing and gene drives as a precision and time efficient technology, though unpredictable and unreliable, as a magic bullet for every problem in agriculture and health. In their haste, they side-step any regulation² and don't give a minute's thought to the attendant ethical, moral and safety concerns. For them, each magic bullet will become a patent which will bring immeasurable profit³.

CRISPR, the new diamond in genetic engineering, has been described as "a relatively easy way to alter any organism's DNA, just as a computer user can edit a word in a document"⁴.

⁴ Pollack, Andrew. "Jennifer Doudna, a Pioneer Who Helped Simplify Genome Editing." *The New York Times*, May 11, 2015, sec. Science. <https://www.nytimes.com/2015/05/12/science/jennifer-doudna-crispr-cas9-genetic-engineering.html>

Gates has been quick to invest and promote CRISPR technology, funding the two leading biochemists developing the technology, Jennifer Doudna, University of Berkeley, California, and Feng Zhang, MIT McGovern Institute and the Broad Institute⁵.

It is a simple yet powerful tool for editing genomes in seemingly any organism on Earth, including humans, allowing researchers to easily alter DNA sequences and modify gene function⁶. It should come as no surprise that the technology is eliciting major concerns and ethical and moral questions⁷.

The paradigm of genetic engineering is based on genetic determinism and genetic reductionism. It is based on a non-acceptance of the self-organised, evolutionary potential of living organisms and treats living organisms as a Lego play set. But it is not child's play. Life is complex, self-organised, dynamic evolution – autopoietic.

As Jonathan Latham cautions, ordinary CRISPR “can induce mutations at sites that differ by as many as five nucleotides from the intended target”, i.e. CRISPR may act at unknown sites in the genome where it is not wanted (Fu et al., 2014)⁸. This shows how unreliable and misinformed are the assumptions and projections that genome editing techniques like CRISPR are precise, predictable, and therefore safe and so need for Biosafety regulation.

Bill Gates and 13 other investors have poured \$120 million into a “revolutionary gene-editing startup” ‘Editas Medecine’ a new leading genome editing company focusing on CRISPR genome editing systems - co-founded by Feng Zhang⁹. The piracy of common genomic data of millions of plants bred by peasants is termed “big data”. But big data is not long-held farmers intellectual knowledge. It is biopirated and privateered data. As Editas has stated “Investing in intellectual property is one component how we are building the company to be a leader in genomic medicine,”¹⁰. Its lead investor is a newly created firm

called BioNano Genomics (bng0), a select group of family offices led by Boris Nikolic, who was previously a science advisor to Bill Gates. Both Editas and Gates' office confirm that the Microsoft billionaire, who is the world's second richest man, is a major investor in the genomic firm bng0¹¹.

Thus biotechnology, information technology, and financial technology are being integrated into one mega machine, transforming life into a money making casino.

It is of note that Doudna and Editas (Zheng), both heavily funded by Gates, are engaged in a patent battle on CRISPR technologies. No matter who loses, Gates wins¹².

The attempt to deregulate new gene edited GMOs and rushing them commercially on the market is to falsely assert they are "natural". However, new research has established that Gene editing is not "natural", that it can in fact be tested, and therefore should be regulated for Biosafety as a GMO¹³.

The European Court of Justice in July 2018 had ruled that CRISPR is a gene modification technology and needs to be regulated like all GMOs. "In today's judgment, the Court of Justice takes the view, first of all, that organisms obtained by mutagenesis are GMOs within the meaning of the GMO Directive, in so far as the techniques and methods of mutagenesis alter the genetic material of an organism in a way that does not occur naturally. It follows that those organisms come, in principle, within the scope of the GMO Directive and are subject to the obligations laid down by that directive"¹⁴.

This ruling was put to the test in the UK when the House of Lords voted against a Trojan amendment' 275 in the Agriculture Bill which was pushing to introduce gene editing as "natural"¹⁵.

It can be assumed that the industry hopes that the introduction of the new gene edited GMOs will cover up the failure of old GMOs – the failure of Bt cotton to control pests and the failure of Roundup Ready crops to control weeds.

Nonetheless, industrial agriculture is still faced with managing the unmanageable problem of superpests and superweeds.

CRISPR technology poses serious health risks. Two studies published earlier this summer found that editing cells with CRISPR/Cas9 could increase the chance that the cells being altered to treat disease could become cancerous or trigger the development of cancer in other cells¹⁶.

Some high-placed scientists like the former director of the US National Institute of Health, have called for a self-imposed ethical moratorium on CRISPR until more is known, particularly on these germline mutations that could potentially be passed on through generations¹⁷. The risk of unintended permanent mutation in CRISPR technology calls for the precautionary principle and a moratorium until we have full understanding of the risks involved and the potential harm and mutation to the human body and other species.

CRISPR could potentially permanently alter an entire population. Once out, there is no going back. A failure to properly anticipate all the effects and consequences could be apocalyptic¹⁸.

GENE EDITING: UNEXPECTED OUTCOMES AND RISKS^{1 2}

GM Watch, Technical advisor: Dr Michael Antoniou

More papers have been published on unintended outcomes and risks of gene editing in medical research on human and animal cells and laboratory animals, compared with plants.

The results have implications for the gene editing of farm animals. The problems found with human and animal gene editing are increasingly being confirmed in plant gene editing.

The unintended mutational (DNA damaging) outcomes summarized below occur after the gene-editing tool has completed its task of creating a double-strand DNA break. The mutations occur as a consequence of the cell's DNA repair machinery, over which the genetic engineer has no control. So even if scientists eventually succeed in avoiding off-target mutations, most of the unintended mutations described can still occur at the intended gene-editing site.

This lack of full control of the gene-editing procedure, as well as gaps in our knowledge of outcomes, point to the need for strict regulation of gene editing in food crops and farm animals. Regulation must start from consideration of the genetic engineering process used to create the gene-edited organism ("process-based regulation"), so that regulators know where things can go wrong and what to look for.

NEED FOR REGULATION

New GM plants do not have a history of safe use and should not be exempted from biosafety assessments.

UNINTENDED MUTATIONS

Below is a selection of studies showing different types of unintended mutations resulting from gene editing that can affect the functioning of multiple gene systems. The consequences are an alteration in the plant's protein and biochemical function, which could lead to poor crop performance and/or the production of novel toxins and allergens or higher levels of existing toxins and allergens.

Off-target mutations

Gene-editing tools, especially CRISPR, are prone to causing mutations (damage) to the organism's DNA at locations other than the intended edit site ("off-target mutations"). This can alter the function of other genes, with unknown consequences to biochemical composition and function.

Large deletions and rearrangements of DNA at both off-target and on-target gene editing sites

Large deletions and rearrangements of the plant's genome, which can involve thousands of base units of DNA, have been observed following CRISPR gene editing. These mutations can affect the functioning of many genes, leading to alterations in the plant's protein and biochemical composition.

Smits AH et al (2019). *Nat Methods* 16, 1087–1093.¹³

Gene-editing process-induced mutations

The gene editing process, taken as a whole (including plant tissue culture and GM transformation procedure), induces hundreds of unintended mutations throughout the genome of the plant. This can affect multiple gene functions with unknown consequences to protein biochemistry and metabolic activity.

Tang X et al (2018). *Genome Biology* 19:84.¹⁴

Insertion of foreign and contaminating DNA into genome at editing sites

Following creation of a double-strand DNA break by the CRISPR gene-editing tool, the repair can unexpectedly include the insertion and rejoining of the broken DNA ends of the recombination template DNA used in SDN-2 and -3, or the insertion of contaminating DNA present in materials used in the plant tissue culture. This insertion of extraneous DNA in the genome of the plant, which can take place at off-target sites as well as the intended on-target editing site, has the effect of introducing new gene functions, as well as disrupting the function of host genes. These effects can combine to alter the biochemical function of the plant in unexpected ways. Reports (Norris et al., 2020; Skryabin et al., 2020; Molteni 2020) describe insertion of the whole plasmid DNA molecules that acted as the recombination template for the SDN-2 or SDN-3 procedure. The insertion of these plasmid DNA templates will invariably result in at least one antibiotic resistance gene being incorporated in the genome, as these are a component of plasmids. This risks the transfer of antibiotic resistance genes to disease-causing bacteria in the environment and more worryingly, in the gut of the consumer, which would compromise medical use of antibiotics.

Seed Freedom

A Global Citizens' Report

Co-ordinated by Navdanya

SECTION 2

BIOPIRACY: THE PLUNDER OF BIODIVERSITY AND KNOWLEDGE

DIGITAL BIOPIRACY TO UNDERMINE INTERNATIONAL TREATIES THAT PROTECT BIODIVERSITY AND PREVENT BIOPIRACY

In 1992, the International community created the UN Convention on Biodiversity (CBD)¹ which recognised the sovereignty of communities and countries to their biodiversity and knowledge. The Nagoya Protocol² under the Convention was meant to regulate the access to Biodiversity. Similarly, consequent to the FAO conference on Plant Genetic Resources in Leipzig in 1996³, the International Treaty on Plant Genetic Resources, or Seed Treaty⁴ was negotiated in the FAO.

Gates, and his push to digitalise every aspect of life, undermines the CBD and the FAO Seed Treaty through Digital Sequence Information (DSI)⁵ and patents based on digital genome mapping.

A TREATY TO PROTECT OUR AGRICULTURAL BIODIVERSITY ¹

Josè Esquinas-Alcazar

For centuries peasants have stored, selected, and exchanged seeds by keeping them in an evolutionary relationship with the surrounding environment. This is a heritage of humanity that has suddenly been threatened by the regime of the Green Revolution and by multinationals' entrance into the seed sector. If over the last thousands of years humanity had more than 10,000 natural species available for their nutrition, today we have just a little more than 150 commodities grown for commercial use. Amongst them, only 12 of those make up 80% of the global food supply and 4 of them alone, being rice, wheat, corn, and potato, cover more than half of our consumption.

The damage to biodiversity has been so significant that the same FAO, starting from the 1970s, began negotiations for the creation of a **UN International Treaty on Plant Genetic Resources for Food and Agriculture**, to contain biodiversity erosion. To this day, the Treaty, which came into force in 2004², is the only international instrument protecting local farmers' rights to save and exchange their seeds within biodiverse systems. The Treaty provides for a global genetic resources reserve of 64 plant species that alone represent 80% of our fruits and vegetables consumption. This Treaty must be continuously strengthened and protected from economic interests, in the awareness of its inestimable value for the future of humanity. In November 2019, the biennial meeting for the Treaty took place in Rome which, according to many observers, was a failure precisely because of the huge economic corporate interests present.

In terms of the hoped-for and necessary advances for the protection of biodiversity, the focus on what was considered by many to be the most important, namely the updating of the benefit-sharing mechanism whereby those who receive plant genetic resources included in the multilateral system are required to pay a fair share of the benefits generated by the marketing of those products, we must acknowledge that no agreement has been reached. However, we should not consider it a failure; because the Treaty is constantly under definition there are still many positive aspects. Firstly, there has been no criticism of the Treaty as such. It has been consolidated and is regarded as a reference of fundamental importance by all - even by the seeds industry, that would not be able to work without access to genetic resources. Then there was the Rome meeting with the ratification of the USA and Japan, which took place only 2 years ago in 2018, almost 15 years after the European countries. Progress has also been made on farmers' rights and the important initiative on the monitoring and study of good practices, which will continue over the next two years, into 2022. The next phase is

¹ Extract from: Masucci, Manlio. 'Un accordo per tutelare la biodiversità agricola'. *Terra Nuova*, 16 Feb. 2020, <http://www.terranuova.it/Il-Mensile/Un-accordo-per-tutelare-la-biodiversita-agricola>

² FAO Newsroom, Treaty on biodiversity to become law, 31 March 2004 - Rome, <http://www.fao.org/newsroom/en/news/2004/39887/index.html>

now being realized, that of interpretation of the Treaty, especially on those parts where the text has become obsolete as a result of the introduction of new technologies. It is preferred to not reach an agreement, rather than make a bad one. Therefore, as far as the benefit-sharing mechanism is concerned, it was decided to postpone the discussion, also because in the meantime, the huge issue of Digital Sequence Information (DSI)³ has opened up and presents several issues.

DSI is about the digitalization of all genetic information related to seeds. In this way, it is possible to improve varieties without having access to the actual seed, but by simply using genetic sequences. This new technological milestone obviously has an immediate economic impact because some countries and seed companies, when using DSI, do not want to recognise the obligation of benefits distribution.

On the other hand, it is also true that it was the farmers who have developed the original varieties in the first place, and that - without those seeds - there would be no information available. This is like agreeing to buy a printed book but refusing to pay the digital version of the same book, even though the copyrights are the same. We are facing a revolution in the way we conceptualize seeds. We cannot allow for them to be defined as mere sequences of genetic information because they are real genetic resources. We must insist on establishing this principle. In 2 years' time in Rome, an agreement will need to be reached: we cannot afford to lose further biodiversity in times of climate change, when we will need resilient varieties to be available to everyone. The issue is so important, that we have no right to pessimism.

In the early stages of the process, small producers and multinationals agreed to sit at the same table the latter accepted the idea that an agreement had to be reached. As in the second half of the 1970s the loss of agroecological diversity became clear to everyone, including the FAO who had promoted the Green Revolution and even the multinationals. Every farmer had his/her own heterogeneous local varieties that had been replaced with a few commercial homogeneous varieties, which resulted more productive only by using fertilizers and pesticides. The increase in productivity was achieved at the price of biodiversity and local identity loss.

Everyone realised what the issue was, and the importance of biodiversity. Uniformity equals vulnerability, and it is therefore essential to preserve biological diversity in order to cope with both plant diseases and environmental changes. *Ex situ*⁴ germplasm banks do not solve the problem because they store frozen germplasm. In this way, also the evolution of the plant freezes, and no longer

³ African Centre for Biodiversity, Third World Network, Prudence versus Pressure at the Seed Treaty, October 2019, https://www.acbio.org.za/sites/default/files/documents/Prudence_versus_Pressure_at_the_Seed_Treaty.pdf#_blank

⁴ "Ex-Situ Conservation Definition | Biodiversity A-Z." <https://biodiversitya-z.org/content/ex-situ-conservation>

develops the ability to adapt to new conditions. Only "in situ"⁵ conservation guarantees the preservation of a living seed that has the ability to adapt. The beginning of the negotiation was difficult, and we had to organize "secret meetings" to inform journalists and politicians about the facts. That was until we managed to convince the FAO to promote an international agreement.

The Treaty is also crucial because of inter-country interdependence. For example, what happened in Ireland in the 1940s, when potato crops, which was the national staple food, were attacked by a fungus, the *Phytophthora infestans*. The famine that followed is considered one of the greatest catastrophes in European history as it caused the death of some two million people. But what was the underlying problem? Why was it impossible to cope with the disease? The answer is simple and brings us back to the dangerous concept of uniformity: at the end of the 1500s, a handful of uniform varieties of potatoes were introduced into Ireland. And it is because of that uniformity that the *Phytophthora* fungus was able to spread easily. The conquistadors had only brought that one variety. At that point, how could this problem that threatened the rest of Europe be solved? European agronomists had to return to Latin America, and precisely to Peru, to find other diverse resistant varieties to eradicate the disease. But this is not an old story.

"A selection of Chiloé's roughly 400 native varieties of potatoes". Source: https://en.wikipedia.org/wiki/Potatoes_of_Chilo%C3%A9

⁵ "In-Situ Conservation Definition | Biodiversity A-Z." <https://biodiversitya-z.org/content/in-situ-conservation>

For example, in 1971, a corn disease attacked all American hybrid varieties and wiped them all out. Confronted with evidence that commercial varieties could not adapt, agronomists searched and found resistant varieties in Africa. Diversity is what saved Europe and the United States. The only difference with the great Irish famine is that there were not millions of deaths, but billions of dollars lost. This explains the inter-country interdependence, where small farmers of Latin America solve the problems of Europe and small farmers of Africa solve the problems of the USA. In times of climate change, stability and uniformity are suicidal. These cases have recurred and continue to happen today.

Although inter-country interdependence is a fact, the dispute between developed and developing countries is always heated. At the last meeting in Rome, the chairmanship was entrusted to the USA and the working groups were unbalanced in favour of the developed countries behind which the interests of seed companies lie. This great paradox already existed in the 1970s. As the greatest diversity resides in developing countries while the most important germplasm banks are located in developed countries, whom do these genetic resources belong to?

According to the law, they belong to the country that preserves them. There was then a need to develop an agreement to make sure that these resources remained a patrimony of humanity. But even if they were declared a patrimony of humanity, who would use them? Still, the rich countries. That is why I speak of a paradox - the poorest countries, which were the actual suppliers of the raw material, had to pay royalties on the seeds afterwards.

We have now lost the beautiful concept of the Patrimony of Humanity in the Treaty, but we have come to a fairly good agreement that includes the multilateral system of benefit sharing, which includes economic benefits. Profits from new varieties will be channelled into an international financial mechanism aimed at financing projects for the benefit of farmers in developing countries. This was not an easy objective to achieve. In the beginning, the US opposed the principle that multinationals should be required to pay a percentage of their revenues. I remember that during the deadlock it was the multinationals themselves who declared that they would agree to pay a percentage. This episode tells us two things: the first is that it is vital for companies to have access to genetic material, and the second is that governments, in their efforts to defend multinationals, are often more royalist than the king.

But the multilateral system of benefit sharing has to be improved because so far, it's gathered very little revenue. It is a mechanism overloaded with bureaucracy. Moreover, there is the issue of having to trust the company that starts to calculate the percentages only after the commercialization of the new variety takes place, which often happens about 8 years after the acquisition of the genetic resources. As a matter of fact, payment for access to resources is supposed to be guaranteed. In short, it is a self-regulating mechanism that has not worked that well so far, to the point that it had to be supported by voluntary funds from countries.

Still, the Treaty is considered binding and it is important for farmers and consumers. It has been ratified by almost 150 countries. All legislation must adapt to it. Of course, concrete implementation depends on the priorities of each country. In Italy, for example, some regions have decided to apply it in advance without waiting for a national law.

As far as farmers are concerned, the Treaty is an instrument against the overwhelming power of multinationals. It recognises the rights of farmers, as guardians of agricultural biological diversity and traditional knowledge. Nothing must oppose the exchange of conservation and breeding of traditional varieties. As far as consumers are concerned, it is necessary to inform them that without biodiversity there is no diversity in their plates.

Nor do we have the right nourishment in industrial products whose production does not respect the environment, as territories are poisoned and biodiversity destroyed, while products travel thousands of kilometres and are full of chemicals. In Europe we are spending 700 million euros a year on diseases caused by junk food. The problem is that farmers are disappearing because they cannot compete with an industrial agriculture that does not pay for externalities. And with what results? Much more than we need is being produced but people are still dying of hunger or diseases caused by poor nutrition. A third of the food produced is also being thrown away. In Spain, each inhabitant throws away an average of 160 kilos of food per year. The employment factor is also affected. Today in Spain only 2.5% of the population works in agriculture and unemployment rates are sky-high. The employment factor is also an externality of the agribusiness system. In short, for every euro we pay in the agribusiness market, we pay two euros plus tax to reduce the negative effects. The real price of the food we buy is three times higher. We must reverse this situation, starting with the elimination of subsidies to industrial agriculture.

Apple diversity, Italy

DIGITAL SEQUENCE INFORMATION (DSI) AND THE INTERNATIONAL TREATY ON GENETIC RESOURCES

Josè Esquinas-Alcazar

When the International Treaty was being negotiated there was a debate over what the treaty should be named. It was deliberately decided that the name should be referent to 'genetic resources' and not 'Seeds' (as was proposed by some countries), since what is really considered valuable is not the seed understood as a physical support, but the genetic resource or information contained in its genes.

In the same way that all the information contained in a book is coded in a 28-letter vocabulary (in the case of the Spanish language) which are repeated by changing the sequence of the letters, in the case of seeds the information is "written" in their genes in a vocabulary of only four "letters" (bases): Adenine, Guanine, Thymine and Cytosine. In both cases it is the sequence or order in which the respective "letters" appear that allows all the different messages in the book or all the characteristics of the plant to be expressed.

When we scientists can "read" the genetic code of a traditional seed or variety, it is possible to reproduce it with no other limits than those imposed by the available technology. Today, Digital Sequential Information (DSI) technology allows us to access these genetic resources, reproduce and use them without the need to have access to the physical or tangible seed.

For the reader of a book, it is its content, regardless of whether we have access to it physically or virtually, which is why the copyright is paid in both cases. Similarly, for the researcher or seed company, the value of a traditional variety or seed depends on its genes or genetic sequences regardless of whether we have access to them physically (seed) or virtually (DSI).

The crux of the matter is that the ISD is not only information but the Genetic Resource in virtual form and therefore its access, use and benefit sharing should be regulated as a Genetic Resource and not simply as information in the Multilateral System of Access and Benefit Sharing of the International Treaty.

If we were to allow access to the virtual genetic resource (DSI), without the obligation to share benefits, we would have emptied the treaty of its content and thrown overboard 30 years of difficult negotiations in search of a balance (ABS) between the interests of those who contribute their genetic resources and those who contribute the technology.

BEYOND GREEN GOLD: MEGADIVERSE COUNTRIES AS PROVIDERS OF GENETIC RESOURCES AND DIGITAL SEQUENCE INFORMATION

Aidé Jiménez-Martínez
Adelita San Vicente Tello

The Convention on Biological Diversity (CBD), which came into effect in 1993, has three main objectives: “The conservation of biological diversity; the sustainable use of its components; and the fair and equitable sharing of benefits arising from genetic resources”. According to Article 1, these objectives may be achieved through, “appropriate access to genetic resources and by appropriate transfer of relevant technologies, taking into account all rights over those resources and to technologies, and by appropriate funding” (CBD).

As stated in Article 2 of the CBD, the definition of “technology” includes “biotechnology” which is defined as “any technological application that uses biological systems, living organisms, or derivatives thereof, to make or modify products or processes for specific use” (CBD). It is evident that this technology necessarily depends on genetic diversity, which is found in megadiverse countries such as Mexico.

In December of 2016, three important international meetings took place simultaneously in Cancun, Mexico: 1) the 13th meeting of the Conference of the Parties (COP) of the Convention of Biological Diversity (CBD); 2) the 8th COP of the Cartagena Protocol on the Biosecurity of Biotechnology, and; 3) the 2nd COP of the Nagoya Protocol (NP) on Access to Genetic Resources and Associated Traditional Knowledge. In all three of the meetings, emphasis was placed on “the very worrying shift towards a predominantly mercantile view of nature and the growing influence of the business sector at different levels of the organisation, in conferences, projects and activities of the Convention and its associated bodies. The participation of the business sector [in the CBD] through the Global Partnership for Business and Biodiversity is becoming increasingly important” (Betancourt, 2016).

In fact, it was during one of the meetings of the Conference of the Parties (COP) that the hosting delegation first began to promote the use of “integration of biodiversity” as a concept. This term quickly became mainstream in the COP and its official language, English, while in Spanish it began to be interpreted as the integration of biodiversity according to its exchange value, or in other words, its commercial potential.

Conversely, Mexico was the first of those countries that ratified the Nagoya Protocol to show to the world the way in which it might be implemented; it was applied to the maize species called *olotón*, a hugely important variety owing to its ability to “fix nitrogen” in the atmosphere. The Mexican Secretariat of Environment and Natural Resources (SEMARNAT) “welcomed the fact that in Mexico the

benefits established by the Nagoya Protocol were already being reflected, particularly with regards to the legal certainty needed for the use of genetic resources, by establishing measures to prevent their improper use" (SEMARNAT, 2018).

In these same meetings of the COP, it became evident that digital sequence information (DSI) was an increasingly important topic for attendees and sparking several debates on this particular approach to the storage of genetic information. So significant was it, that the 196 countries present at the meeting "agreed to investigate the ways in which digital sequence information might be used in new forms of biopiracy" (Böll, 2016).

DSI facilitates "digital biopiracy" because it allows for the downloading of genetic sequences of plants, microorganisms and seeds from the Internet, which can later be used to recreate physical DNA using methods taken from synthetic biology. This may be done without considering any potential benefit for the countries and communities from which the organisms originate, and in which this genetic information is based (Böll, 2016). DSI may include the following: sequences of nucleotides which form part of deoxyribonucleic acid (DNA), sequences of ribonucleic acid (RNA), amino acids which form proteins, chemical compounds derived from genetic information (metabolites) and even environmental information or information related to ecological interactions between sequences (epigenetics), as well as any other resulting information.

Today, there exist millions of DSI in public and private databases. These sequences can be used and modified for commercial purposes and patented, without following any of the basic principles established by the NP; in other words, their use does not necessarily imply any financial or non-financial benefits to the Parties, which provide those resources. They may not even require Prior Informed Consent (PIC) or Mutually Agreed Terms (MAT), much less the fair and equal sharing of the benefits that result from the use of genetic resources.

DSI are intrinsic to "physical" genetic resources and the two are therefore inseparable. Gaining access to DSI without following the main regulations of the NP encourages biopiracy and leads to unilateral economic benefits which miss the most important aim of the CBD; "the conservation and sustainable use of biological diversity". It is precisely for this reason, that it is important to recognize that DSI should be considered as valuable as any "physical" genetic resource.

Furthermore, the present low-cost of genetic sequencing and the free availability of DSI in databases are both factors that are contributing to a reduction in the need for "physical" access to genetic resources.

In Cancun, a very important agreement was reached: to request opinions with governments, civil society, indigenous and local communities so as to know their opinions on the theme of genetic resources as well as to establish ad hoc groups of technical experts to analyze these discussions (CBD, 2016). This agreement was envisaged as a starting point from which to begin analyzing the

implications of digital sequence information. It must be recognized that “the members of the CBD took an enormous step forward in addressing the controversial theme of digital biopiracy as a means of attending to the many legal gaps that exist in the Convention on Biological Diversity. Although its true to say that some Northern countries with powerful biotechnological industries (such as Canada) tried to have the theme of digital biopiracy removed from the discussion agenda, ultimately everyone agreed that the issue warranted deeper scrutiny and that this would be addressed as part of future meetings” (Böll, 2016).

It is crucial to recognise that open access to DSI has been fundamental to scientific research, which has resulted in studies that expand our knowledge of the many different aspects of genetic resources, both in evolutionary and taxonomic terms as well as in relation to diversity and conservation. Similarly, it has played a fundamental role in the development of medicines, and the diagnosis and molecular identification of organisms of biomedical interest, particularly in the field of public health, amongst others.

However, open access to this information has also been considered *res nullius*, a legal term translated as “nobody’s thing”, which means that digital databases containing genetic information uploaded by researchers are freely available to companies and other parties who generate intellectual property rights over sequences with no regard for the existing ancestral work and knowledge that indigenous communities hold on that particular information.

The use of DSI implies great responsibility and its possible repercussions require ethical principles. Therefore, in order to fulfil the 3rd aim of the CBD, those researchers who upload sequences onto digital platforms must commit themselves to providing data that helps in the traceability of the aforementioned DSI. Finally, it must be said that open access does not mean unrestricted or unregulated access, because at least theoretically one could benefit from and make use of DSI obtained through unethical or bad practices.

As a megadiverse country, Mexico is an important provider of genetic resources and thus of many different kinds of DSI. It is acknowledged that biodiversity continues to be the inheritance of indigenous and local communities who, using the profound knowledge built up over centuries, and practices such as seed exchange and the sustainable management of nature, have managed to create and recreate biodiversity in line with their cosmologies which imply a positive and congruent relationship between communities and their environments. For this reason, it is clear that there is a need to promote of biocultural heritage (Toledo, 2008) as a strategic position, particularly for megadiverse countries, who are more likely to be providers of genetic resources and therefore, also, of DSI.

However, in past decades, successive neoliberal governments in Mexico (1982-2018) opened many of the nation’s vital resources up to the transnational market, and amongst those were genetic resources. It is calculated that “since 1996, [the Mexican government] has authorized 4,238 permits for scientific collection” (Betancourt, 2016) and many of these authorizations have resulted in

"Maize, the sacred grain used in the rituals of indigenous agriculture", by Jack Zalium, is licensed under CC BY 2.0 (<https://creativecommons.org/licenses/by/2.0/deed.en>).

profiteering. Access was even provided to sensitive genetic resources such as those found in maize. Access to the genetic wealth of this particular cereal and the growing interest in its commercial potential was also demonstrated by a joint-visit made by Bill Gates and Mexico's richest man, Carlos Slim, to the International Centre for the Improvement of Maize and Wheat (CIMMYT) in Texcoco, State of Mexico. There they announced "the investment of 25 million dollars by the Bill & Melinda Gates Foundation and the Carlos Slim Foundation to CIMMYT, which, founded in 1943, had been an initiative of the Mexican government and the Rockefeller Foundation, in which the father of the Green Revolution, Normal Borlaug, had worked" (Nuel, 2013).

The current government, which was democratically elected in 2018, is determined to work for the poorest in society, to protect the sovereignty of the

resources that belong to the nation, and to ensure that indigenous communities are the true beneficiaries, thereby recognising their central role in the conservation of biodiversity. In this way, the government is working to include in local legislation and with great precision the guidelines set out by the NP, therefore reinforcing the vision that indigenous communities already have of their biocultural heritage. Regarding DSI, it is essential that criteria is specified to establish with clarity what the commitments and obligations of users of DSI databases should be so that they might be obliged to share the benefits and not avoid those measures indicated by the NP.

If regulation is often one step behind technology, then time is of the essence and the issue of access to DSI must be discussed and analysed in the 15th COP, through the lens of biculturalism. The challenge for all participating sectors is to face the issue head-on, and although it will not be easy, not to do so risks rendering the Nagoya Protocol meaningless.

BIOPIRACY OF CLIMATE RESILIENT SEEDS ¹

Navdanya

Biodiversity creates the resiliency needed in seeds to recover from climate disasters.

The Biotechnology industry and the Gates Foundation are intent on using the climate crisis as an opportunity to push GMOs to biopirate and patent climate resilient seeds and deepen their monopoly on the world's seed supply².

Chemical agriculture and the globalized food system are responsible for 40-50% of all greenhouse gas emissions³ that contribute to climate change⁴.

Both centralized systems and chemical-based monocultures are much more vulnerable to failure and collapse in unstable and climate extremes. It stands to reason therefore that GMOs and monopolies are not the answer to mitigating or adapting to climate change, or reversing biodiversity erosion for that matter, being embedded in chemical monocultures and centralised monopolistic control over the seed supply.

How the Gates Foundation Presents the Biopiracy of Flood Tolerant Rice as "Innovation"

Problem: In areas of Asia and Africa where rice-growing farmers depend on rain fed agriculture, rice productivity is low and unstable due to stresses such as flooding, drought, and poor soils⁵.

Flooding regularly afflicts over 6 million hectares in South Asia⁶ and as much as one-third of the rain-fed lowland rice-growing areas in sub-Saharan Africa⁷.

<https://doi.org/10.1111/gcb.13967>

Neither newer rice varieties nor farmers' traditional varieties are able to survive prolonged submergence under water.

There is a need for new rice varieties that can withstand a range of environmental stresses.

Innovation: Harness the knowledge of leading global, regional, and national agricultural researchers and combine it with local know-how to develop and distribute submergence-tolerant rice to small farmers.

Through Stress Tolerant Rice for Africa and Asia (STRASA), the International Rice Research Institute (IRRI) partners with researchers at the Africa Rice Centre, an African research organisation, and national scientists in poor countries, creating submergence-tolerant rice varieties that can “hold its breath” underwater.

STRASA developed improved varieties through identifying and using traits that allow rice to make better use of oxygen even while submerged, therefore coping with this stress that can devastate crops⁸.

However, Climate resilience is a complex trait and cannot be “engineered” through the crude tools of transferring single gene traits from one organism to another. What corporations and the Gates foundation are doing is taking farmers' varieties with known climate resilient traits from public gene banks, mapping their genome, and taking patents on the basis of guesswork and speculation on which part of the genome contributes to the known trait.

Like Columbus -- who, setting out for India, getting lost and arriving in the Americas, “discovered” “America” -- Gates and Monsanto are “discovering” climate resilience.

Just as the narrative of Columbus' discovery erases the indigenous people who lived across the American continent, the patenting of climate resilience erases farmers breeding, and the biodiversity which they have given us. It erases the source of the seed, the culture of the seed, the commons of the seed. It is an enclosure through piracy - Biopiracy.

Patenting life through genetic engineering is rapidly giving way to patenting life through mapping the genome.

Navdanya's Community Seed Bank in Orissa has conserved more than 800 rice varieties and multiplied and distributed salt tolerant varieties and flood tolerant varieties. The “innovation” to evolve these climate resilient traits has occurred cumulatively and collectively over thousands of years. These traits and crops are a commons.

However, the biotech industry are now presenting the traits evolved by nature and farmers over centuries as the “invention” of “scientists”, who rename the flood tolerant property in the farmer's variety, such as “Dhullaputia” from

⁸ “STRASA Legacy Site - Flood-Tolerant.” *IRRI STRASA Legacy Site*.
<https://sites.google.com/irri.org/strasalegacy/varietal-releases/submergence>

Orissa, as the Sub1A or the submergence tolerant gene. They proudly state “Using marker-assisted selection (/not transgenics) the researchers were able to isolate the submergence tolerant gene, Sub1A, and then transfer it to a rice variety that is grown on more than 5 million hectares in India and Bangladesh, known as Swarna. Most rice can tolerate flooding for only a few days, but researchers say the new variety, Swarna-Sub1, can withstand submergence for two weeks without affecting yields”⁹.

This is a scientifically flawed description based on genetic reductionism because flood tolerant traits, like other climate resilient traits such as salt tolerance and drought tolerance, are multi-genetic traits. They cannot be identified as a “Sub1A gene” because it is not simply just “a gene”, which they have referred to as “Submergence tolerance 1 (Sub1) Quantitative trait locus (QTL)”.

What marker assisted selection does, is identify the genetic sequence that is always linked to varieties which share a trait¹⁰. Such varieties are then selected for crossing conventionally with varieties like Swarna.

Farmers who have bred the traits did not need marker assisted selection to breed for climate resilience. The diversity and pluralism of knowledge systems, and diversity of languages to describe and name processes and organisms must be recognized.

Gates steals centuries of breeding by farmers and describes it as a new flood-tolerant rice which will offer relief for the world's poorest farmers¹¹. This is how the Gates Foundation redefines the Biopiracy of flood-tolerant rice from India's farmers as ‘innovation’ having the consequence that farmers as breeders disappear, meaning the source of flood tolerant traits disappears. They become recipients of that which came from them in the first place. This is the regime of Bio Nullius, building on the concept of Terra Nullius¹² – that farmers’ minds are ‘empty’, and their seeds ‘empty’ and ‘innovation’ only begins when Gates and Big Money takeover.)

Adapting to an unpredictable, changing climate requires diversity at every level. Biodiverse and decentralized systems have shown to be more resilient in times of climate change and have more flexibility to respond^{13 14}.

We also need biodiversity at the level of knowledge systems¹⁵.

Biodiversity of knowledge implies that we recognise the ever-evolving knowledge of women, farmers, tribals, citizens which comes from their life experience, their intimate connection with the Earth and local ecosystems as well as its biodiversity. We need to recognise the emerging sciences of agroecology and epigenetics.

At the ecosystems level, agroecology is also a systems paradigm. This is the real science of agriculture and food production, not biotechnology.

We also need biodiversity in our economic activities. We need local food systems, regional food systems, national food systems, while some trade can take place at the international level.

Finally, we need Biodiversity of political systems and decision making. Centralised and bureaucratic systems are like dinosaurs. They are not flexible and cannot adapt and evolve.

We need flexibility, which comes from diversity. Biodiversity in politics is what I call Earth Democracy.

BANANA BIOPIRACY THROUGH GMO BANANA

Vandana Shiva

There persists a 'creation myth' that is blind to nature's creativity and biodiversity, and to the creativity, intelligence, and knowledge of women. According to this 'creation myth' of capitalist patriarchy, rich and powerful men are the 'creators' and can pirate our knowledge and biodiversity. They can own seeds, plants, life through patents and intellectual property. They can tinker with nature's complex evolution over millennia and claim that their trivial, yet destructive acts of gene manipulation 'create' life, 'create' food, 'create' nutrition.

GMOS have been the means to own and control life through Patents. When Patents are taken on Biodiversity and Knowledge, evolved and conserved over millennia by indigenous cultures, it is called Biopiracy.

In the case of GM bananas it is one rich man, Bill Gates, financing one Australian scientist, Dr. James Dale at Queensland University of Technology, Australia, who knows one crop, the banana, to impose inefficient and hazardous GM bananas on millions of people in India and Uganda who have grown hundreds of banana varieties over thousands of years in addition to thousands of other crops. The Mantasa piece which follows is an excellent account of how "Dr Dale's globe-trotting GMO bananas are a globe-trotting case of biopiracy and biocolonialism".

Gates funded Dr. Dale to push iron enriched GMO bananas on India for reducing iron deficiency in anemic women in India and prevent death in childbirth.

Nature has given us a cornucopia of biodiversity, rich in nutrients. Malnutrition and nutrient deficiency results from destroying biodiversity, and with-it rich sources of nutrition. Pushing the Green Revolution in the name of increasing farm outputs for a burgeoning population of consumers has spread monocultures of chemical rice and wheat, driving out biodiversity from our farms and diets.

What survived the onslaught were uncultivated wild crops like the amaranth greens and chenopodium (bathua), which are rich in iron, despite being sprayed with poisons and herbicides, while optimizing growth of other crops. Instead of being seen as iron rich and vitamin rich resources, they were treated as 'weeds'.

As the 'monoculture of the mind' took over, biodiversity disappeared from our farms and our food. The destruction of biodiverse rich cultivation and diets has led to a malnutrition crisis, with 75% women now suffering from iron deficiency.

India's indigenous biodiversity offers rich sources of iron: Amaranth has 11.0 mg per 100 gm of food, buckwheat 15.5, neem 25.3, bajra 8.0, rice bran 35.0, rice flakes 20.0 bengal gram roasted 9.5, bengal gram leaves 23.8, cowpea 8.6, horse gram 6.77, amaranth greens have up to 38.5, karonda 39.1, lotus stem 60.6,

coconut meal 69.4, niger seeds 56.7, cloves 11.7, cumin seeds 11.7, mace 12.3, mango powder (amchur) 45.2, pippali 62.1, poppy seeds 15.9, tamarind pulp 17.0, turmeric 67.8, raisins 7.7¹.

The knowledge of growing this diversity and transforming it to food is an integral part of women's knowledge, the reason for Navdanya creating a network for food sovereignty and putting it in women's hands – Mahila Anna Swaraj.

The solution to malnutrition lies in growing nutrition, and growing nutrition means growing biodiversity. It means recognizing the knowledge of biodiversity and nutrition among millions of Indian women who have received it over generations as "grandmothers' knowledge".

There is a curious urge among the biotechnology brigade to declare war against biodiversity in its centre of origin. An attempt was made to introduce Bt brinjal into India, which is the centre of diversity for brinjal. GM corn is being introduced in Mexico, the centre of diversity of corn. The GM banana is being introduced in two countries where banana is a significant crop and has large diversity. One is India, the other is Uganda, the only country where banana is a staple. The women of India succeeded in stopping the Gates GMO banana from being imposed on India, which falsely claimed it would save women's lives. It is still under field trials in Uganda after 10 years and millions of dollars to complete the research².

Not only is the GM banana not the best choice for providing iron in our diet, it further threatens the biodiversity of bananas and iron rich crops, and, as recognized by Harvest Plus, the corporate alliance pushing Biofortification, there could be insurmountable problems with the biofortification of nutrients in foods as they '...may deliver toxic amounts of nutrients to an individual and also cause its associated side effects (and) the potential that the fortified products will still not be a solution to nutrient deficiencies amongst low income populations who may not be able to afford the new product and children who may not be able to consume adequate amounts'³.

CAMPAIGN - 'NO GMO BANANA'

Navdanya International - Seed Freedom Global Campaign

The No GMO Banana international campaign was launched by Navdanya and partners Mantasa, to stop the controversial project of Dr. James Dale of Queensland University of Technology, Australia, beneficiary of 15 million dollars in investment from the Bill and Melinda Gates Foundation. A petition was sent to the Prime Minister of India urging the cancelation of the project and agreement between the Department of Biotechnology and the University of Queensland in Australia, and to instead use the money to support a national movement of community and kitchen gardens in women's hands¹.

After a meeting with farmers in Kediri, Indonesia² who highlighted their yellow and red bananas, Navdanya and the Indonesian activists decided to form a joint project to research Vit A rich indigenous bananas and explore from where the developers of GMO bananas got the vit A traits, leading to the GMO Banana Biopiracy research and campaign. They found that the beta-carotene rich traits had been pirated from an indigenous Micronesian banana. This led to the international Stop Banana Biopiracy campaign³ and to an Open Letter to Dr James Dale at QUT, the Bill and Melinda Gates Foundation and the Convention on Biological Diversity⁴.

News also spread of banana feeding trials using students from Iowa State University (ISU) as guinea pigs, also funded by the Gates Foundation. In addition to the

ethical violations involved in Biopiracy of Banana, these unapproved human trials also were clearly another serious ethical violation, prompting graduate students at Iowa State to stage a silent protest in October 2014⁵, though the University refused to engage publicly or respond to issues raised by the students. The Alliance for Food Sovereignty in Africa (AFSA), Dr. Wendy White from Iowa State University and the Human

Institutional Review Board of Iowa State University subsequently submitted an open letter and petition to the Bill and Melinda Gates Foundation expressing fierce opposition to the trials ISU⁶ while ISU graduate students dispatched a petition with 57,309 signatures⁶ to the College of Agriculture and Life Sciences with AGRA Watch members delivering the same petition to the headquarters of the Bill and Melinda Gates Foundation in Seattle, Washington. In April 2016, the petition was delivered to Dr Dale⁷ at QUT in Australia, by Dr Vandana Shiva⁷, along with the above-mentioned Open Letter by the Alliance for Food Sovereignty in Africa. The Indian campaign

In addition to succeeding in stopping the Gates GMO banana from being imposed on India, these international campaigns against GMO Bananas⁸ served to connect the issues of GMOs, Biopiracy, and the ethical violations of human trials by connecting movements in Asia, Africa, Australia and the US. It helped expose the colonialist mindset behind the project and the multiple human rights issues connected with it. The campaign also showed the absurdity of GMO bananas when there are so many more effective solutions to issues of nutritional and iron deficiencies

BANANA BIOPIRACY: AN OPEN LETTER TO QUT'S DR JAMES DALE, THE BILL AND MELINDA GATES FOUNDATION AND THE CONVENTION ON BIOLOGICAL DIVERSITY ¹

Mantasa

Paul Gauguin, *Le Repas (The Meal)*, 1891

The Gates Foundation has invested 15 million dollars in Dr James Dale's GMO so-called 'super-bananas' developed at Queensland University of Technology (QUT) since approximately 2005. The project is being touted as philanthropy with a humanitarian purpose in combating micronutrient deficiency. The GMO bananas have gained considerable media attention for the project, but it is not at all clear that the GMO banana project is truly a charitable exercise. It is however a clear case of biopiracy.

Fe'i bananas (*Musa troglodytarum* L.) are a traditional food across the Asia-Pacific, found in an area ranging from Maluku in Indonesia to Tahiti and Hawaii in the Pacific. Until fairly recently local consumption of Fe'i bananas across the region had been largely displaced by imported, unhealthy, colonial food cultures.

¹ Extracted from: Mantasa. "No Gmo Banana Republic – Stop Banana Biopiracy!" *Seed Freedom*. Last modified October 12, 2014. <https://seedfreedom.info/no-gmo-banana-republic-stop-banana-biopiracy/>

In the early 2000's US researcher Lois Englberger, living in Micronesia, after searching for sources of vitamin A in the traditional diet of Micronesia, found that Micronesian 'Karat' bananas – so called because of their orange 'carrot-like' flesh and subsequent high beta-carotene content – had been traditionally used in Micronesia as an infant weaning food².

Paul Gauguin, *La Orana Maria (The Virgin Mary)*, 1891

Based on Englberger's work, the Federated States of Micronesia have an ongoing program to bring back and encourage the cultivation and consumption of these local banana varieties³. Englberger's work with the Island Food Community of Pohnpei in FSM has seen the use of these varieties widely adopted in a campaign called 'Let's Go Local!'. The program has been so successful that the Karat banana has been adopted as the state emblem of Pohnpei⁴.

Englberger's work however, did include nutritional surveying of pacific banana cultivars in Australia held in collection by the Queensland Department of Primary Industries⁵:

"What Dr Dale has done is to take the high beta-carotene banana gene for his GMO 'super-bananas' from an existing Fe'i banana variety from Papua New Guinea, following a study⁶ that compared ten cultivars with yellow to orange fruit. The 'winner' was the Asupina cultivar⁷, which had the highest level of trans beta-carotene – the most important pro-vitamin A carotenoid. . . more than 25 times more than the level in the Cavendish cultivars that dominate the international banana trade. The trouble is, this makes Dr Dales' GMO 'super-banana' a clear case of biopiracy. The original Asupina, collected 25 years earlier from Papua New Guinea and held by the Queensland Department of Primary Industries (Q-DPI), is the rightful property of the nation and the communities that developed it" ⁸.

The Asupina is not a wild variety as Dr Dale has claimed⁹ – it is a domesticated cultivar from PNG. It is also not unpleasant to eat as Dr Dale has also claimed. As Englberger was at pains to point out, there are Fe'i banana varieties that are delicious when eaten raw, baked or boiled.

Paul Gauguin, (Tahitian Landscape), 1891

Dr Dale's globe-trotting GMO bananas are a globe-trotting case of biopiracy. The traditional knowledge they have used comes from Micronesia and Lois Englberger's work. The Q-DPI public collection from which Jeff Daniels sourced the Asupina variety should have been a collection held in public trust. Their GMO 'super banana' project, on which Dr Dale holds multiple patents for 'banana transformation', now proposes to

sell these purloined treasures back to the world as their own patented product from which they can derive royalties, determine access, and is ironically being offered up as an act of charity. Rather this is an act of biocolonialism.

Moreover, the GMO 'super-bananas' are an expensive distraction away from real solutions for vitamin A deficiency. We do not need to waste time and millions on GMOs when we have viable existing solutions that are based on biodiversity and available right now. Malnutrition is a complex problem that cannot be solved by monocultural solutions whether of the mind or of the field, not by 'Golden Rice' nor the cartoon solution of GMO 'super-bananas'.

Taking resources away from communities can only be done violently.

The GMO banana project began violently, with the unacknowledged theft of traditional knowledge and cultural heritage of local communities and farmers in PNG and Micronesia, which has now been enclosed in patents for 'banana transformation'.

It continued violently with the Market Trials conducted on unsuspecting human subjects in Iowa - female students, who were being paid 900 dollars to turn themselves into human guinea pigs, while no safety tests for human consumption of the GMO bananas have been done.

SECTION 3

ONE EMPIRE OVER AGRICULTURE

Ag One: Recolonisation of Agriculture

GATES AG-ONE AND THE RECOLONISATION OF AGRICULTURE

Navdanya

Bill Gates having become a billionaire through the deregulation of corporate globalisation is now leading the recolonization of Asian, Latin American and African Agriculture. Gates has taken the failed Green Revolution to Africa as AGRA (the Alliance for the Green Revolution in Africa) and now has launched the same initiative under the new name AgOne¹. This time pushing the new technologically updated Green Revolution to shape the future of Agriculture.

What is AgOne and what is its aim?

In January 2020, a new initiative announced by the Gates foundation called “The Bill & Melinda Gates Agricultural Innovations LLC”, or “Gates Ag One” in short was launched. Gates Ag One was formulated to be a subsidiary of the Gates Foundation and is to be led by Joe Cornelius, the previous director of the BMGF Global Growth & Opportunity Division. It is interesting to note that Cornelius came from being the former food, nutrition and technology development executive at Bayer Crop Science, following his previous position, in the 1990s, as Director for International Development at Monsanto.²

It is being hailed as a new non-profit to “bring scientific breakthroughs to smallholder farmers whose yields are threatened by the effects of climate change” and shrink the supposed ‘productivity gaps’ present in Africa, Asia, and Latin America.³ It will work with the Gates Foundation’s Agricultural Development Team and other partners across sectors to “accelerate the development of innovations” that are “needed to improve crop productivity and help smallholder farmers, the majority of whom are women, adapt to climate change”.⁴

The goal of Gates Ag One is claimed to be “to empower smallholder farmers with the affordable, high-quality tools, technologies, and resources they need to lift themselves out of poverty.” According to the creation document, “yields on farms in these regions are already far below what farmers elsewhere in the world achieve, and climate change will make their crops even less productive.”⁵

⁴ Ibid.

⁵ “Gates Foundation on Intention to Create Nonprofit Agricultural Research Institute.” *Bill & Melinda Gates Foundation | Press Releases*, January 21, 2020. <https://www.gatesfoundation.org/Media->

Rodger Voorhies, president of the Foundation's Global Growth & Opportunity division, has said that Gates Ag One plans to work with partners from the *public and private sector to commercialize* "resilient, yield-enhancing seeds and traits". He adds, "We needed to accelerate the access to the kinds of products and services that low income people and smallholder farmers need," due to the long time it takes for these new discoveries to move from invention, to development, to lab testing and then once commercially viable for the field, to move through regulation. ⁶ Voorhies explains, "We didn't think that research was flowing down to the crops that matter most to smallholder farmers in a timeframe that could reach them...But ultimately the Gates Foundation did not see another way to ensure that early-stage discoveries, such as water use efficiency for crops that will face extremes of droughts and floods, are made accessible and affordable to smallholder farmers as quickly as possible."⁷ In short they are hoping to artificially accelerate the process of introducing 'new technologies' to farmers through increased investment and public and private partnerships while having total freedom in their business model as a separate entity to the Bill and Melinda Gates Foundation.

Where will it work?

In a document released by the Gates foundation itself, it is claimed that Ag One will work in "South Asia - with a population of about 1.8 billion - and Sub-Saharan Africa- home to around 1 billion people."⁸

⁸ Ibid.

What is not mentioned in their creation statement is the implementation of the AgOne programme in Latin America, called 'AgTech', through a partnership with Inter-American Institute for Cooperation on Agriculture (IICA).⁹ The programme's initiation point is planned to be in Argentina, to then subsequently be implemented throughout the rest of Latin America.

Ag One, Gates Global Commission on Adaptation and the takeover of the CGIAR system

Overlapping behind several of the initiatives launched by Bill and Melinda Gates, is a characteristic urgency that all new technologies and mitigation efforts must be pushed, adopted and quickly implemented in the name of stopping climate change. This rhetoric stands to mask a wide section of the Gates' initiatives, organizations, and funding schemes whose real purpose actually runs counter to any type of true climate change alleviation.

The same is true for AgOne, as the foundation is tied indirectly to another Gates initiative called the Gates Global Commission on Adaptation¹⁰ focused exactly on only pushing technological solutions to climate change adaptation and mitigation, through such things as filling in the 'data gap' of the global south, green smart cities, and increased development (and return investment) opportunities through these efforts. AgOne was, therefore, launched as part of its 2019 year of Climate action.¹¹

The Global Commission on Adaptation hosts as its co-chairs, along with Gates, some international organization heavyweights such as the previous 8th secretary general of the UN, Ban-Ki Moon who serves as the head of the organization's board, and Kristalina Georgieva, the current managing director at the International Monetary Fund (IMF).

Forming part of AgOne's strategy will be the doubling of funding to CGIAR, an organization Gates has had his eye on for quite some time. Hence, in September of 2019 at the UN Climate Summit, and as part of the Gates Global Commission on Adaptation's year of climate action, CGIAR announced the gift of more than \$79 million dollars of an investment coalition headed by Bill Gates, and made up of the World Bank, the UK, the Netherlands, the European Commission, Switzerland, Sweden and Germany.¹² According to the CGIAR announcement, *"US \$310 million [is to be given by] the Bill & Melinda Gates Foundation over the next three years to support CGIAR's shared agenda to tackle climate change and make food production in the developing world more productive, resilient and sustainable. The foundation is the second largest donor to CGIAR after the US Agency for International Development (USAID), with investments contributing to*

¹² *Ibid.*

work in crop breeding, seed systems, gender equity, livestock, nutrition, and policy.”¹³ Therefore, aligning the vision of CGIAR with that of AgOne.

A move made even more significant as, the recently released ETC report states, a new System Reference Group (SRG) struck in 2018, has delivered its recommendations in July 2019 calling for the formal consolidation of the 15 Centers of the (CGIAR) into one. The meeting of the 15 Center Chairs was convened at Bioversity International (BI) headquarters outside Rome in December 2019 to discuss the “mega-merger”. The consolidation would involve one international board which would be responsible for all 15 Centers.¹⁴ The dangers seem imminent when one looks deeper and sees that the SRG is co-chaired by Tony Cavalieri, Senior Program Officer of the Bill & Melinda Gates Foundation, and Marco Ferroni, Chair of the System Management Board and recently retired as head of the Syngenta Foundation. The unification is being pushed by Gates and Syngenta Foundations, USAID, UK, Canada, Australia and Germany. Unification will mean an even stronger blurring of lines between the private and public sectors. Private agendas of making profits will be clothed as the public agenda. Now to be even further blurred through the launching of AgOne. This also provides unprecedented leverage in individual country policy and mass access to genetic seed resources. This hunger for influencing global food policy comes as no surprise as the Gates’ foundation website itself states, “a key trigger of agricultural transformation is a conducive policy environment.”¹⁵

When one reads the agenda of the newly launched AgOne, one can also not help but think of the rhetoric of 2008 launched Alliance for the Green Revolution in Africa or AGRA, which essentially served to revamp the ghost of the already dead and failed Green Revolution of the 1960s. Considering the multiple alliances to Agrochem companies, one can only assume AgOne is meant to pick up AGRA’s baton with a new tech twist, and run to the rest of the global south.

Poison Cartel and Gates Foundation:

The fact that Ag One will be based in St. Louis, Missouri USA, home of Monsanto and other GMO and pesticide giants, is not a coincidence. AgOne claims to “empower smallholder farmers” by providing more accessible technology to help them face climate change. This sounds eerily like Bayer who also claims to “empower 100 million smallholder farmers around the world by providing more access to sustainable farming solutions – all by the year 2030.” Through looking at examples of current and past co-investments, one can start to see what ‘private-partnerships’ will most likely emerge in AgOne’s quest to “empower smallholder farmers to lift themselves out of poverty.” In 2010, a US financial website published the Gates foundation’s annual investment portfolio,

Poison Cartel.Toxic Capital.

Graphic: Navdanya

which showed it had bought 500,000 Monsanto shares around \$23m.¹⁶ More recently, publications of Gates' Annual investment portfolio, or "strategic investment fund" which is stated to allow the foundation to advance its 'philanthropic goals' through investments in for-profit companies, showed a \$7 million equity stake in AgBiome, a biotech start-up focused on developing synthetic biological products through CRISPR technology for the agricultural sector.¹⁷ A start-up who also holds investments from agrochem companies Monsanto and Syngenta and who the Gates foundation gave a \$20 million grant to develop pesticides for Africa.¹⁸

This shows just one of the numerous ventures where Bill and Melinda Gates Foundation and Monsanto have invested together with a false narrative of "helping the poor in South Africa". Pivot Bio, a biotech startup that focuses on making nitrogen fixing microbes, being another example. Pivot Bio also being another Gates Foundation funded startup who later received another \$70 million dollars, and who holds investments from Monsanto Growth Ventures and the US's Defense Advanced Research Projects Agency or DARPA.¹⁹

More explicitly, with its launch of the Latin American AgOne, 'AgTech', IICA has announced partnerships for its implementation with Microsoft²⁰, Bayer²¹, Corteva²², and Syngenta²³, all along with the Bill and Melinda Gates Foundation.

By looking to the outcomes of AGRA we can start to see what pattern wishes to be repeated with all of these strategic alliances in the launching of AgOne. Through the Gates foundation's promotion of chemical and genetically modified inputs, they have worked to essentially open up previously isolated or hard to reach markets in Africa, South Asia and Latin America for the benefit of private corporations, as these patented 'high-yield' seeds are not owned by no one and investments are very clearly made for for-profit companies. The commercialization mentioned by Voorhies means private company profit.

Source: <https://agra.org/ar-2019/#2019-highlights>

To be specific, in 2008, the year AGRA was launched, South Africa was the only African country that had approved the use of GM seeds. Subsequently, GM seeds were expanded to the previously GM-free Egypt, Burkina Faso, and Sudan. While other countries such as Ghana, Kenya, Tanzania, Uganda, Malawi, Mali, Zimbabwe, and Nigeria began conducting research into GM crops. By 2017, some countries had even moved into implementing field trials.²⁴ This huge expansion of GM crop use, particularly maize, is a consequence of large-scale promotion directly aimed at increasing market share to the large agribusiness companies that own the patented seed. Those patented GM seeds also go along with their accoutrements of chemical inputs, all promoted through alliances with agrochemical companies through the guises of AGRA. In sum, roughly ten years after the revival of the Green Revolution through AGRA, industrial agriculture expanded in some form or another, from one country to eleven, showcasing a huge expansion in BigAg business. As explained by Tim Wise in his report on AGRA, in 10 years, productivity rates in these countries only increased due to these inputs being highly subsidized, and were nowhere near enough to alleviate poverty and hunger.²⁵ Meaning only big agrochemical companies directly benefited from Gates' push for 'agricultural development'.

This comes as no surprise, as in a video shot by the Gates Foundation to explain the necessity of development of agricultural innovation, Gates exposes the Green Revolution as being, "the most significant advancement in human

²⁴ Curtis, M. 2016. Gated Development: Is the Gates Foundation Always a Force for Good? Second Ed., Global Justice Now. June 2016. Pg. 31. https://www.globaljustice.org.uk/sites/default/files/files/resources/gjn_gates_report_june_2016_web_final_version_2.pdf

²⁵ Wise, Timothy A. "AGRA at Ten Years: Searching for Evidence of a Green Revolution in Africa," November 2017. <https://afsafrika.org/wp-content/uploads/2019/10/agrawiseprelimfindings2017.pdf>

history behind modern medicine, due to its ability to drastically increase yields."²⁶ With just this one statement, which shows his full scale support of industrial agriculture, we can almost guarantee this pattern will be repeated with the implementation of AgOne.

Unveiling the rhetoric of Ag One

Once one begins to look closely at the AgOne concept note, one can quickly start to pick apart how its rhetoric is completely disconnected from any true lived experience of the impacts of the first Green Revolution, as well as its unprecedented global ecological, social, economic and cultural impacts. Contrary to what Bill Gates might think, agroecological food systems are overall more productive, more resilient to climate change, and provide greater livelihood security.

Rhetoric 1: *"Yields on farms in regions like Sub-Saharan Africa and South Asia are already far below what farmers elsewhere in the world achieve and in the future the crop production will further worsen because of climate change" and so we need Ag One to "accelerate the development of innovations" that are "needed to improve crop productivity".*

Counter: Contrary to the myth that small farmers and their agroecological systems are unproductive, and we should leave the future of our food in the hands of the Poison Cartel, small farmers are providing 80% of global food using just 25% of the land that goes into agriculture.²⁷ There have also been countless studies that have proven that agroecological, organic agriculture, especially those based on biodiversity, are all around more resilient to climate change, more economically viable and lead to increases in crop productivity.²⁸ For example, biodiversity helps reduce diseases in agroecosystems, improving the resilience of the plant and inevitably leading to higher yields.

The diversity of knowledge embedded in agroecological and traditional farming systems also provides a greater safety net for confronting extreme weather patterns and ecological shifts. As stated by Altieri et. Al in the study over the climate resiliencies of agroecological systems, "Observations of agricultural

performance after extreme climatic events (hurricanes and droughts) in the last two decades have revealed that resiliency to climate disasters is closely linked to farms with increased levels of biodiversity."²⁹

Source: <https://link.springer.com/article/10.1007/s13593-015-0285-2>

Rhetoric 2: Ag One will “empower smallholder farmers with the affordable, high-quality tools, technologies, and resources they need to lift themselves out of poverty.”

Source: https://www.researchgate.net/publication/283721240_Social_and_economic_performance_of_Agroecology

Counter: Reliance on internal inputs and recycling of resources leads to less cash strain for costly chemical inputs. Coupled with increased productivity, this means farmers are better able to meet their monetary needs and overall livelihoods. This fact was corroborated in a study presented at the 2nd International Conference on Global Food Security, through looking at global comparative data. The study found that adopting agroecological farming practices, generally led to increased crop yield and profitability in comparison to conventional practices.³⁰

²⁹ Altieri M.A., Nicholls C., Henao A., Lana M., Agroecology and the design of climate change-resilient farming systems, 869 – 890, 35 (3), SN 1773-0155, Springer, Agronomy for Sustainable Development, 2015, <https://link.springer.com/article/10.1007/s13593-015-0285-2>

³⁰ D'Annolfo, Raffaele & Gemmill-Herren, Barbara & Graeub, Benjamin & Garibaldi, Lucas. (2015). Social and economic performance of Agroecology. https://www.researchgate.net/publication/283721240_Social_and_economic_performance_of_Agroecology

So, this begs the question, does being lifted out of poverty mean being folded into the commodity market? Considering Gates' longstanding alliance with giant industrial agriculture companies, this is most likely the objective. While farmers have bred hundreds of thousands of varieties, of thousands of species, the Green Revolution has reduced the agriculture and food base to a handful of globally traded commodities, with only 30 plants supplying 95% of global food demand.³¹ Genetic Engineering has further narrowed the commercially planted crops to four - Corn, Soya, Cotton, Canola and 2 traits - Bt and HT (herbicide tolerant). This reduction of marketable crops also creates a flooding of commodity crops which keep prices low, making it all the more difficult for small-scale nonorganic farmers to make a living.

Regardless, such a simplistic view of simply solving poverty with technological innovation reduces the multidimensionality of why certain populations remain poor.

Through this and similar rhetorics, Gates pushes the philanthropist ethic where the rich give to the poor, painting the rich as providing favors to the poor they exploited to gain their wealth, in the end making the poor evermore dependent on the rich. Coupled with his development agenda, a chimera of 'charity development' emerges which reinforces the power structures of inequality in the areas where they work, reiterating the trope of white saviorism.

For example, Gates chief scientist at Microsoft Azure Global, Ranveer Chandra who is in charge of developing sensors for data gathering on farms through the FarmBeats project, has himself, as well as Gates, readily admit they have no expertise in agronomy, biology, farming or related fields, but still believe that through computer and data science, they can solve complex, multidimensional ecological and social problems, such as poverty.³² Reiterating the trope of the technical expert who comes to bestow the poor with their knowledge, never leading to empowerment but only to dependence. In the end this reductionist way of implementing top-down technologies, works to deepen global poverty through creating further dependence on centralized high-cost inputs.

Rhetoric 3: *“Smallholder farmers are involved in unsustainable practices like grazing into forests which affects fragile ecosystems and will cause further damage to the environment and exacerbate the effects of climate change.”*

Counter: Commodity based, fossil fuel intensive, monocultural industrial agriculture is, by far, more responsible for the effects of climate change and ecosystem destruction.³³ Chemical pesticides are directly responsible for the mass killing of

birds and insects.³⁴ Fossil fuels are used in almost every step of the industrial food system from, in the field through nitrogen fertilizers, diesel fuel for the myriad of industrial agricultural equipment, to transportation of commodities in the international supply chain, their storage, and eventually their disposal.³⁵ Nitrogen fertilizers also pollute water sources, dry out land and destroy soil.³⁶ Leading to, overall, more water being necessary in industrial agriculture leading to furthering the global water strain.³⁷

The true culprits of large-scale deforestation has been the industrial agriculture sector, who' search for the perpetual amplification of the agricultural frontier is responsible for 70-90% of global deforestation.³⁸ The land cleared is then used for the production of chemically intensive monocultures of commodity crops like maize, soy, sugarcane, cotton, palm oil and so on. These crops are then used in industrial food making processes, biofuels, or animal feed - creating a vicious cycle of GHG emissions with the other areas of the industrialized food system.³⁹ Gates seems to completely disregard this, as in 2016, he invested \$14 million into biofuel conversion company Renmatix. A company who produces a technology to aid in the conversion of biomass to cellulose sugars for biofuels.⁴⁰ Biofuels have been responsible for the clearance of rainforests all around the world, especially in the Amazon in Brazil, not small farmers.⁴¹

⁴¹ "Sugar Cane, Palm Oil, and Biofuels in the Amazon." *Yale School of the Environment | Global Forest Atlas*, n.d. <https://globalforestatlas.yale.edu/amazon/land-use-and-agriculture/biofuels>

By framing the narrative in a way that pins the responsibility of climate change on “smallholder farmers who are involved in unsustainable practices” the Gates foundation evades responsibility for the destruction it has been instrumental in causing. We cannot address climate change, and its very real consequences, without recognising the central role of the industrial and globalised food system, actively supported by the Gates Foundation. The globalised food system contributes from 44% to 57% of all greenhouse gas emissions through deforestation, industrial inputs (such as chemical fertilizers, petrol, fertilizer, irrigation and so on), animals in concentrated animal feeding operations (CAFOs), plastics and aluminium packaging, long distance transport and food waste.⁴²

Source: <https://www.grain.org/e/4357>

We cannot solve climate change without small-scale, ecological agriculture, based on biodiversity through living seeds, living soils, living and local food systems. A proven way to decrease CO₂ emissions is exactly through local food economies which eliminate fossil fuel intensive methods, and global supply chains, in favor of resource recycling, low intensity inputs to heal the soil, and biodiversity. Slow, whole, organic diets increase nutrition and lessen climate impact in a multidimensional fashion.⁴³

Rhetoric 4: *“we believe that everyone has the right to live a healthy, productive life. But many of the world’s poorest people—those who make their living through agriculture—will not have that opportunity unless they can access the innovations needed to adapt to the challenges caused by climate change” and we will “help smallholder farmers, the majority of whom are women, adapt to climate change”.*

Counter: They make it sound like farmers cannot live a healthy and productive life without technology. They also make it sound like the only way to face climate change is with the help of their “innovations” when they will profit massively from them. Through this elevation of technological means to human ends, the corporate agenda is made the human agenda, imposition is defined as “inclusion” and “Democratization”. Corporations endow their tools with inevitability and rob societies of thinking of options and alternatives. However, there is no inevitability in the tools humanity uses. Chemicals and the Green Revolution were not inevitable. They were imposed through conditionalities⁴⁴. The failures of the Green Revolution and its ‘innovations’ do not provide a solid base

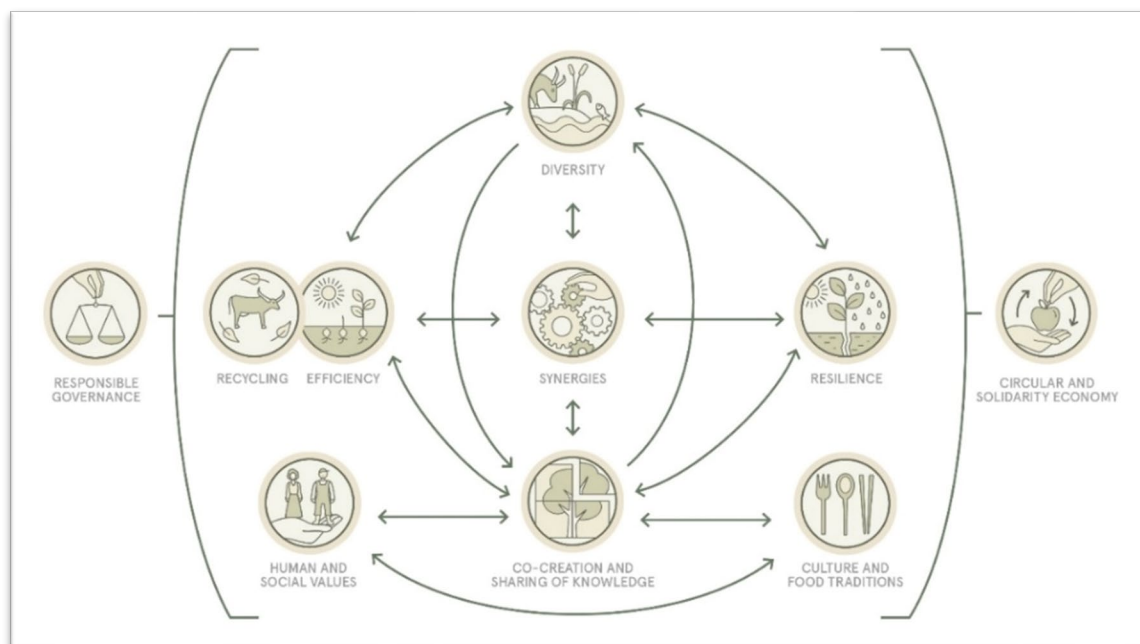

⁴² Ibid.

⁴³ Ibid.

⁴⁴ Ibid.

for the argument of new technological innovations⁴⁵. Technology itself also greatly impacts climate change through its whole chain of its material extraction, production, distribution and waste processing⁴⁶. A new technological fundamentalism makes corporate tools a measure and indicator of human progress, immune to social and democratic assessments.

With the ecological emergency, climate emergency and the food emergency, the technologies that are needed are participatory and evolutionary, breeding for climate resilience, for increasing nutrition, and making agriculture poison free.

"Interaction of the 10 Elements of Agroecology". Source: FAO, <http://www.fao.org/agroecology/knowledge/10-elements/en/>

The urgency implied around the need for technological solutions to climate change provides the mask through which they can push the universal adoption of a new series of data-reliant technologies. Since climate change is 'new' there must also be a 'new, innovative' solution to solve it, leading to a new wave of epistemic colonization. "One Agriculture One Science"⁴⁷ essentially means "one research and one knowledge". In a world of diversity, claiming to be the "One" is a design for Imperialism. It is a design for epistemic colonisation. It is a denial of the richness of agroecological knowledges and practices that are resurging around the world.

CONSTRUCTIONS AND TECHNOLOGICAL MYTHS TO COLONISE OUR FOOD AND FARMING SYSTEMS

- Corporations turn a blind eye to farmers' innovations and the knowledge and tools farmers have evolved over millennia to breed seeds, renew soil fertility, manage pests and weeds ecologically and produce good food.
- They elevate corporate tools to a new religion and new civilizing mission which has to be imposed to civilize the ecological, independent, knowledge sovereign farmers who are seen as the new barbarians. A new technological fundamentalism makes corporate tools a measure and indicator of human progress, immune to social and democratic assessments. Farmers have a fundamental democratic right to compare their agroecological tools with what the Poison Cartel has to offer and with full knowledge and information make a democratic choice. Through this elevation of technological means to human ends, the corporate agenda is made the human agenda, imposition is defined as "inclusion" and "democratization".
- Corporations endow their tools with inevitability and rob societies of thinking of options and alternatives. However, there is no inevitability in the tools humanity uses. Chemicals and the Green Revolution were not inevitable. They were imposed through conditionalities. GMOs are not inevitable and are failing as tools of pest control and weed control, leading instead to emergence of superpests and superweeds. There is multiple and diverse intelligence in nature and society. Artificial Intelligence or machine learning is not inevitable. It is being imposed through forced digitalization, making us forget the intelligence in nature and her diverse living beings, the intelligence in the soil food web, the ecological intelligence of farmers and women, the intelligence of the microbes in our gut and the enteric nervous system: our second brain.

When society develops and chooses technologies democratically the questions we ask are:

What does the technology do?

What is the tool for? Who controls the tools?

Do we have technological alternatives to address the same problem?

Do we need them for improving human wellbeing and the wellbeing of all species?

What are the ecological impacts of the tools on life on earth and human health?

What are the social impacts of the tools?

The Gates Agenda: Subverting our International Treaties and Biodiversity

Undermining the Protection of Biodiversity

Convention on Biological Diversity

In 1992, the international community adopted this convention at Rio De Janeiro at the Earth Summit.

The objectives of the convention were:

- Conserving biological diversity
- Sustainable use of resources
- Fair and equitable sharing of benefits that arise out of commercial use

Nagoya Protocol

Under CBD, there are multiple protocols created. One of them is the Nagoya protocol on access and benefit sharing, 2010.

The objective was to establish a legally binding framework for the implementation of the concept of access and benefit sharing as birthed in the convention on biological diversity. The protocol creates duties and obligations on the parties engaging with indigenous communities for the use of genetic resources and knowledge.

International Treaty on Plant Genetic Resources Treaty for Food and Agriculture (ITPGRFA)

Also known as the International Seed Treaty, the objective is: conservation and sustainable use of all plant genetic resources for food and agriculture and the fair and equitable sharing of the benefits arising out of their use, in harmony with the Convention on Biological Diversity, for sustainable agriculture and food security.

Digital Mapping: Subverting these Regulations on Access to Biodiversity

These international frameworks made to protect our biodiversity are being completely subverted through digital mapping of the genome. Biopiracy is being carried out through the convergence of information technology and biotechnology by taking patents through "mapping" genomes and genome sequences. While living seed needs to evolve "in situ", patents on genomes can be taken through access to seed "ex situ". This undermines farmers' rights as you don't need the permission from the farmers anymore once the genome has been digitally mapped.

New GMOs: CRISPR and Gene Editing

Gates has been pushing for it several years now, with a huge investment of \$ 120 Million dollars (along with his capitalist friends). Gates used to fund others to get this done, but impatient with lack of progress, he now wants to do it himself.

Source : <https://www.cd-genomics.com/blog/120-million-investment-for-crispr-technology-from-bill-gates-and-other-13-investors/>

Gene editing is a failed technology.

Gene editing has been proven to be a failure because of how inexact and unpredictable it is. It was found that CRISPR introduced more than 1,500 single-nucleotide unintended mutations, more than 100 larger deletions and insertions into the genome of mice.

Source: Shiva, V and Shiva, K. 2018. The Future of our daily bread: Regeneration or Collapse. Navdanya International / Research foundation for science, technology and ecology

Ag One: Sowing the Seeds of Surveillance

Although we have seen how the new AgOne initiative will line up with previous iterations of Gates' attempt to expand the classic, failed methods of the Green Revolution, AgOne also sees the unveiling of a new generation of external input technologies. The focus of AgOne is to transition small farmers to use 'new digital tools and technologies'. Principally referenced are the 'yield-enhancing' or drought tolerant seeds which include old and new types of GMOs, as well as CRISPR technologies adopted on seeds and living plants.

Gates has been pushing for CRISPR and gene editing several years now. In 2016 an investment firm called bngo headed by former science advisor to Gates, Boris Nikolic, and of whom Gates is a backer, provided a huge seed investment of \$120 million dollars to fund Cambridge's Editas Medicine- one of the first to research and develop CRISPR technology.⁴⁸ Since then he has publicly expressed his full fledged support of CRISPR for its use in agriculture and medicine.

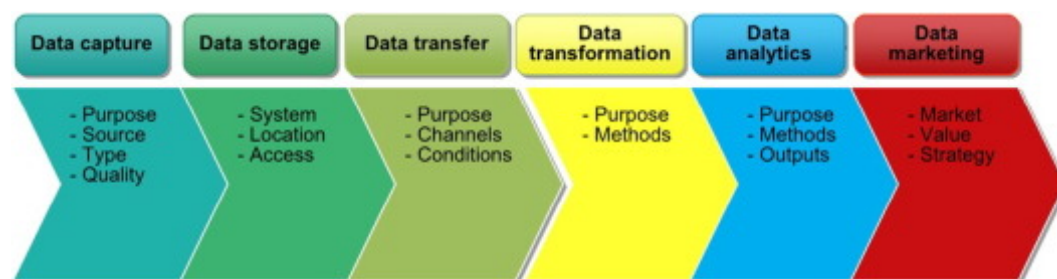

The other most important aspect is the use of digital agricultural extension through sensors to gather data points on everything from mapping soil moisture, weather patterns, soil nutrient levels, individual plant health and so on. The end purpose for the use of such sensors is to fill the 'data-gap' of the global south and provide data as a resource in order to build maps and predictive models of agricultural systems. Big data, data analytics and machine learning are, hence, being incorporated into agriculture through electronic tracing systems, electronic weather data, smartphone mapping and other remote sensing applications, all in order for AI and machine learning to be able to model such things as, when to plant the next season of crops, when to water, when to fertilize or predicting pest outbreaks.

⁴⁸ "\$120 Million-Investment for CRISPR Technology From Bill Gates and Other 13 Investors." *CD Genomics*, October 16, 2018. <https://www.cd-genomics.com/blog/120-million-investment-for-crispr-technology-from-bill-gates-and-other-13-investors/>

This new type of data-reliant agriculture is oriented toward the implementation of precision agriculture, which is essentially a “data-generating agriculture” as it is based on observing and measuring crops, environment variables using sensors and satellites, to supposedly lower the use of chemical inputs. But in the end precision agriculture is a double edge sword, on the one hand it is just a way to placate critiques of the high costs of using chemical inputs, while on the other providing the means to reduce farmers to possible data sets to generate their artificial models. This in turn reduces the world's diversity to only an environment to improve predictive models through the complete disregard for (even the concept of) living systems.

Data mining from Farmers

Such experiments with data mapping are already underway. For example, in India, Digital Green, an initiative of the Gates Foundation is described as “a global development organization that empowers smallholder farmers to lift themselves out of poverty by harnessing the collective power of technology and grassroots-level partnerships.”⁴⁹ It is an NGO that focuses on “training farmers to make and show short videos where they record their problems and share solutions”. It was first conceived as a project in Microsoft Research India's Technology for Emerging Markets. It has received a funding of \$1.3 million dollars from the Walmart foundation. South Asia Food and Nutrition Security Initiative (SAFANSI), a project of the NGO is funded by the World Bank. It received Rs 3 crore or \$400,600 dollars from Global Impact Award from Google in 2013. The Bill and Melinda Gates Foundation has funded more than \$10 million into this initiative.

“The data chain of Big Data applications” is licensed under CC BY-NC-ND 4.0 (<https://creativecommons.org/licenses/by-nc-nd/4.0/>).

Source: <https://www.sciencedirect.com/science/article/pii/S0308521X16303754>

This “data” from the farms and farmers is being collected without their knowledge or prior consent. Problematically, this “data” is also closely connected to farmers' personal information like the location of the farms, their yields and other sensitive information. Farmers also have little say as to what even happens to the data being collected. Bringing in questions of data sovereignty as the data being collected is more than likely to be developed into products that are then sold back to farmers as essential products for successful digital farming. In turn, the very institutions that are pushing for this new data-ag and its regulation are indirectly or directly in the hands of Gates Foundation. The most blatant example being the World Economic Forum's World Food Systems Summit (WFSS), to be hosted in 2021,

⁴⁹ “About Us.” *Digital Green*. <https://www.digitalgreen.org/about-us/>

which is to be headed by former Rwandan Minister of Agriculture and president of Gates-funded AGRA (Alliance for a Green Revolution in Africa). In the concept paper of the summit there was no mention of agroecology, indigenous peoples or civil society, while it does specifically mention precision agriculture and genetic engineering as important for addressing future food security, while also expressing vocal support for the fourth industrial revolution around data.

For the countries where AgOne is looking to operate there is very little legislation, regulation or concrete trade agreements around digital data transfers, leaving countries in the global south with little capacity to handle this new influx of 'data resources' leaving them even more vulnerable to further predation by large corporations. Gates' digital agenda with AgOne will also serve to exacerbate this already stark power inequality through a centralization of all farming data out of the hands of farmers. This centralization also then leaves the door open for further biopiracy, centrally managing data that can only be accessed through paywalls, surveillance and further policing by big corporations of their product use and so on.

The pivotal example of these consequences being the biopiracy being carried out through the convergence of information technology and biotechnology by taking patents through "mapping" genomes and genome sequences⁵⁰. While living seed needs to evolve "in situ", patents on genomes can be taken through access to seed "ex situ". This undermines farmers' rights as you don't need the permission from the farmers anymore once the genome has been digitally mapped.⁵¹

Making time an enemy: A Push for Deregulation

All of this is only possible through an active agenda of deregulation. Using the rhetoric of climate change as the cause for extreme urgency, according to Rodger Voorhies, president of Global Growth & Opportunity division, "Research and development takes years to get from the lab to the field, and while the Agricultural Development team funds the development of new tools and technologies designed to meet the needs of smallholder farmers, there were delays in translating these discoveries to affordable products". He added, "we didn't think that research was flowing down to the crops that matter most to smallholder farmers in a timeframe that could reach them."⁵² But the only way this rush is possible for AgOne is through the agenda of Deregulation of Biosafety. As the initiative announcement states, its objective is to "get the products from the labs into the fields, faster and more massive than before". The objective of AgOne seems to be to fund these new innovative scientific discoveries with hopes of getting them through as quickly as possible to the point of commercialisation with as little testing, assessment and regulation as possible. One such example is of

CRISPR and gene editing where they tried to bypass regulation all together by claiming that gene editing is a non-GMO technology and is different from transgenic.

Building on Thousands of Years of Evolution of Thousands of Diverse Agroecological Knowledges and Cultures

There is an illusion that running faster on the chemical and poison cartel treadmill, now equipped with Artificial Intelligence and Robots will be more effective in producing more food and feeding the hungry. On the contrary, the tools and technologies of the poison cartel have brought the planet and the lives of farmers to the brink with climate havoc, species extinction, water crisis, farmer incomes collapsing to zero and food related diseases killing larger numbers of people.

In the end it appears that Gates' new AgOne initiative is the same wolf in different clothing, where he is attempting to push faster and harder for the whole world to adopt his version of the already failed Green Revolution with a new tech twist. A worldview which is completely disconnected from the realities of small farmers and their need for food system sovereignty.

As shown, the future of agriculture is based on biodiversity, seed sovereignty and agroecology, not on "Ag tech" or "Ag One". We need to rise up and look past the corporate narrative and look towards time tested indigenous knowledge and Agroecology to shape the future of Agriculture based on Biodiversity and Cultural Diversity. We need a rejuvenation of small farms, the real farms with real people who care for the land, who care for life, who care for the future and who produce diverse, healthy, fresh, ecological and real food for all.

THE CASE STUDY OF THE ICRISAT DIGITAL FARMING TOOLS

One such example of digitalization of agriculture comes through a collaboration between ICRISAT and Microsoft in India. Used as a case study by Feed the Future and USAID, ICRISAT is looking to develop four tech initiatives:

Figure 1 Summary of ICRISAT Digital Agriculture Interventions

| DIGITAL AGRICULTURE INVESTMENT | PURPOSE OF THE TOOL | VALUE CHAIN STAGE |
|--|--|--------------------|
| Sowing App and Intelligent Agricultural Systems Advisory Tool (ISAT) | To deliver targeted and timely SMS messages to farmers about sowing and other farm management practices | On-farm production |
| iHub | An incubator program and platform to catalyze technology innovations that can change the lives of farmers | Cross-cutting |
| Plantix | To provide extension officers with automated and targeted responses about diseases and pests through a mobile app | On-farm production |
| LeasyScan | To rapidly measure leaf surface area characteristics and water stress and accelerate the identification of promising new varieties | Planning |
| HarvestMaster | To record highly accurate measurements of grain weight and moisture characteristics for development of new varieties | Planning |

Source: Manfre, Cristina, and Wesley Laytham. "Digitizing the Science of Discovery and the Science of Delivery: A Case Study of ICRISAT." India: USAID, 2018.

https://www.usaid.gov/sites/default/files/documents/15396/ICRISAT_Case_Study.pdf

The ICRISAT case study on Digital Agriculture shows what Gates Ag One has been preparing for. But one flawed assumption made by such initiatives and in particular Gates, is the continued use of 'yield', a failed measure which hides more than it reveals.

Navdanya's research has shown that industrial agriculture is inefficient, unproductive, creates dependency on corporations for eternal inputs, and dependency on global supply chains which impose uniformity on farms. We have shown that "yield" is an unscientific measure which does not reflect true biological productivity. It is a manipulated measure which promotes monocultures, and commodification.¹

To highlight one, the Sowing App and the Intelligent Agricultural Systems Advisory Tool (ISAT) use predictive analytics, Cortana artificial intelligence, and machine learning from multiple weather, soil and crop data points to predict sowing times for farmers and provide them with a series of possible decisions. These programs are reliant on mining farmers data, while then portraying farmers as lacking in intelligence or skill. Farmers of forty centuries did not need an SMS through Microsoft software to know how to sow and farm. Not only is this denial of farmers knowledge and intelligence, it is creating a new dependency on an external input –data. The objective is clearly to undermine food sovereignty and food self-reliance and lock farmers into digital dependency. The ICRISAT case study is a good example of how Gates is attempting to centralize the knowledge wealth and value created by farmers through turning all aspects of an agricultural environment into a data point. Especially since all the business generated by this digitalization partnership is diverted to Microsoft.

GATES AG ONE IN ARGENTINA ¹

Fernando Cabaleiro

Bill Gates has landed in the Argentine agri-food system. He has done so at the hands of the Inter-American Institute for Cooperation on Agriculture (IICA), an international organization supported by the United States of America. A partnership which has clearly blurred the line between the public and the private sectors, since it is truly a covert entity of agribusiness, through which the Bill & Melinda Gates Philanthrocapitalist Foundation has been operating, since 2011, by making contributions and donations.

In 2018, IICA and Bill Gates' Microsoft built a strategic alliance called the "Alliance for Digital Education in the Americas" ² with the objective of implementing a complete digitalization of agriculture, through a broad technological platform developed by Gates' computer company using the Internet of Things (IoT), Big Data and Artificial Intelligence (AI) tools; as well as the application of innovation, information technology and communication in development projects, among others.

Previously, IICA and Microsoft had tested the development of prototypes using the Internet of Things and Artificial Intelligence to combat diseases that occur in coffee cultivation, as well as to create a platform to strengthen people's capacities in terms of agricultural issues.

In addition to the celebrated strategic alliance with Bill Gates, he was joined by the Global Hitss corporation, a subsidiary of American Móvil (owned by billionaire Carlos Slim), to strengthen software applications (apps), and the agrobiotechnology companies Bayer Monsanto, Corteva (Dow, Dupont and Pioneer) and Syngenta ChemChina. ³

The Alliance's one objective is to carry out IICA's Medium-Term Plan (MTP) 2018-2022 for agriculture in the Americas, specifically targeting Argentina and Brazil first, to then implement the plan throughout the Latin American and Caribbean region. IICA's own website states that "pilot programs will be implemented in Brazil and Argentina, in accordance with the definition of priorities for implementing the agreement that the two organizations (IICA and Microsoft) signed in October to work for the benefit of the rural areas of the countries of Latin America and the Caribbean."⁴

The plan is called "AgTech" and was presented in Argentina on June 30, 2020 by Manuel Otero, President of IICA, in the presence of the Ministers of Agriculture and Science of Argentina and other public officials in strategic positions.⁵

"AgTech" is nothing other than the "AgOne" that Bill Gates designed and built from his philanthro-capitalism, developing and investing in research and technology projects in Asia and Africa to be applied in the agro-food system and that have no other purpose than to generate processes of accumulation of capital, economic concentration, appropriation of genetic resources and social domination.

IICA is also in partnership with Bill Gates (along with other foundations) in the formation of the System Reference Group (SRG) which has submitted its recommendations in July 2019 calling for the formal unification of the 15 CGIAR (Consultative Group on International Agricultural Research) centers, with their respective seed banks, into one. The intentions of this group were set out in the document "Feeding the world in a changing climate: an adaptation roadmap for

agriculture" ⁶. IICA itself boasts in the document that with the excuse of accelerating adaptation to climate change, it proposes a transformation of the world agricultural system, "with the task of feeding an ever-growing population and under more extreme climatic conditions... the adaptation of the food production system is urgent in the Americas, not only because of the high vulnerability of the sector to climate change, but also because the maintenance and increase of the continent's food supply to the world depends on it." ⁷

IICA, the Bill Gates Foundation, Bayer/Monsanto, Corteva (Dow, Dupont & Pioneer) and Syngenta, without a doubt, make up the most dangerous alliance for agriculture and food sovereignty for each country in Latin America and the Caribbean.

The objectives of "AgTech/AgOne" cover all the productive processes of the agrifood system which are crossed by Bill Gates' hegemonic and domination design. Not good. The gateway chosen was Argentina, just as Monsanto chose our country in 1996 to release its first transgenic seed.

Ultra-processed synthetic meat, cellular material that tastes like chicken or fish, artificial eggs, corn, soybean and sunflower seeds, as well as all the fruits, vegetables, and greens subjected to genetic editing using the CRISPR technique, grown in unpopulated fields controlled by remote-controlled and programmable drones for

planting, measuring variables, and continuing to spray with new combinations of agrochemicals and synthetic fertilizers with the incorporation of precision software for mapping and collecting all the information on biological and genetic resources. Automation of physical harvesting processes and all stages of intensive agriculture, where machines decide on their own, super cows, super pigs and baby super chicks resulting from biotechnology applied only to increase production without any concern for human health risks and the complete annulment of the knowledge of thousands of years of farmers, is part of what AgTech presented on June 30, 2020.

A kind of relaunch of the agro-industrial model in Argentina. It is about the dehumanization of agriculture itself. A plan alienated from reality and from the consequences of the immunosuppressive agro-industrial model has had as a pivotal co-author of the obligatory social confinement devastating the planet because of the Covid-19 Pandemic.

The AgTech tests the call for a broad deregulatory framework, as if the agro-industrial model did not know about it. It is enough to mention that, in Argentina, GMOs were never subject to any congressional law and that CRISPR crops and new biotechnology events are not even necessarily subject to a risk review, if it is so determined by a consultative body (CONABIA) whose members are not public officials, but rather belong to public and private entities with, in many cases, have serious conflicts of interest due to their agribusiness links.

IICA suggests that it would be valuable for AgTech to have performance legislation (as opposed to indicative legislation) in key regulatory areas to incentivize innovation-based solutions, according to certain specific technical parameters.

Such a requirement by IICA is intended to make the processes involving AgTech subject to permissive and open regulation. The indicative or prescriptive legislation that IICA opposes is based on the constitutional criterion that there are no absolute rights and the law must operate as a social controller, of course not from the perspective of capitalist persecution, but from the viewpoint of the "common good" which forms the basis of the Argentine legal order, as it is the end purpose of the State which, therefore, empowers it to regulate rights.

Likewise, the areas in which AgTech operates, impose technological advances that open up significant uncertainties in such a sensitive area as food, a key determinant of health, where precaution is a legal criterion that cannot be ignored. IICA's approach is more in line with the need to speed up processes and take for granted that there are no risks whatsoever. The proposed deregulation of AgTech is based on Bill Gates' AgOne Biosafety Deregulation Program.

The rhetoric of Ag Tech, obviously the same as that of Bill Gates' AgOne, talks about the need to provide technological innovation to small and medium farmers to increase their production when they do not even have the right to access land. Most of the actors in family, peasant, indigenous and self-managed farms that produce the food (fruits, vegetables and fruits) consumed by the Argentine population do not own the land and are forced to pay high rents. Furthermore, there is talk of increasing key food production through actions to mitigate climate change, however, agriculture continues to be directed towards the production of monocultures such as soy, which is not food for humans but for animal consumption (mainly as exports to China), or the production of biodiesel for fuels whose climate impact is greater than that of fossil fuels.

Since the Green Revolution to date, the agro-industrial regime in Argentina has never been the scene of a democratic debate in the institutional and sovereign space of public policy: the National Congress. We are faced with an autocracy over agriculture that, as it has no diverse democratic content of ideas

and opinions, favors - almost automatically - the monolithic and hegemonic influences of the large agribusiness corporations and of Bill Gates (under the representation of IICA).

By twisting the wills of some government officials, visiting their offices (Directorates, Deputy Secretaries, Ministries), reach their goals to advance expeditious regulations made to the mold of their interests, without the need congressional laws, nor to transit the parliamentary procedures with the due citizen participation that, from their perspectives, are obstacles for their inevitable, urgent and immediate objectives.

Therefore, denouncing is the sovereign act of freedom that we exercise by making visible what is happening in Argentina. As if COVID-19 had nothing to do with the agro-industrial model, and as if

naiveté governs us in believing that Bill Gates and the Agribusiness corporations, now under the lying mantle of IICA, are part of the solution. They are wrong, they are a big part of the problem, and our critical gaze and skepticism did not enter Quarantine.

COLONISING AGRICULTURE THROUGH THE FAILED GREEN REVOLUTION

BILL & MELINDA GATES: THE DYSTOPIA OF THE GREEN REVOLUTION IN AFRICA¹

Nicoletta Dentico

In 2006, just one year before food prices skyrocketed, the Gates Foundation launched the Global Development Programme, whose main focus was agriculture. The money to fund the operation came from the giant and unexpected mountain of money given to him by Warren Buffet, who in turn had been flooded with cash by the activities engaged in during the speculative bubble that would soon burst in the United States. It was enough to cross the sensitivity of the Rockefeller Foundation, and to launch together an invincible proposal: the gospel of the Green Revolution, Rockefeller's old warhorse, and bring it to the underdeveloped African continent.

This is how the Alliance for Green Revolution in Africa (AGRA) was born². The basic concept is always the same. Hunger in Africa is the result of the lack of modernisation of agriculture and the absence of functioning markets. AGRA must fill this gap, it must develop synergistic action with the private sector, it must promote access to markets and disseminate agricultural innovation as a propellant capable of increasing rural productivity. Gates and Rockefeller are AGRA's main sources of funding. As such, they are the ones who identify the problem, direct its solution, place their staff in key positions, and establish the entire approach to the work.

As early as 2001, Gates had already tackled nutrition through seminal funding to the Global Alliance for Improved Nutrition (GAIN³), the first in a series of new public-private alliances on food. GAIN had just been born when it was able to obtain a hasty blessing from the United Nations Assembly meeting in a special session dedicated to children in 2002⁴. The Seattle couple's decision to fund this new reality was a desire "to champion the concept of a major new push for improved nutrition on a global scale, initially through *food fortification, working closely together with the private sector* and leveraging partnerships to achieve the maximum possible scale of impact"⁵. Not only did support for GAIN never stop

⁵ *Ibid.*, p. 375.

- from 2002 to 2014 the alliance received \$251 million from the Gates Foundation out of a total spending budget of \$284 million⁶ - but in 2003 Gates also began funding the research on the Golden Rice project, the genetically modified rice that "can save the lives of millions of children"⁷. The project is definitely of great value to Gates because it experiments with the idea of a "humanitarian licence", granted by Syngenta, as a donation to public institutions and farmers for the cultivation of this rice. This served as the first instance of a *humanitarianisation* of the right to food⁸ which serves to institutionally redefine practices around access to proprietary knowledge, so as to enhance the role of the industrial "donor" as a benefactor, while completely redefining the terms of the GMO debate.

AGRA points in the same direction⁹. AGRA's roots can be traced to a 2006 Rockefeller Foundation document¹⁰ that launched the concept of a dynamic, African-led alliance to help small producers and their families fight poverty and hunger.

AGRA defines Africa's agricultural problem as an issue arising from poor seed varieties, inadequate access to technology, and poor country infrastructure. Reproducing the mechanistic model that had already inspired the first Green Revolution in Asia and Latin America, AGRA was born in September 2006 "to fulfill the vision that "Africa can feed itself and the world, transforming agriculture from a solitary struggle to survive to a business that thrives"¹¹. The purpose is to promote this market ideology as a solution to the productivity deficit of African crops, which philanthropists consider to be the reason why there is a lack of food to feed the growing population of the continent, which is obviously *their* definition of the problem.

AGRA claims to be the largest entity dedicated to eradicating hunger in Africa. The Gates Foundation considers it an "African face and voice of our work". Indeed, it is a subsidiary of the foundation on the continent, given the amount of money invested - about 630 million dollars, since its establishment to date. Its faith in genetic engineering is associated with the plan to develop an intensive industrialized system for Africa involving seed companies and small farmers through agro-dealers platforms. These platforms interact with small and medium-sized companies for the supply of hybrid seeds (maize, sorghum, cassava, soya, bananas, rice, sweet potatoes, beans - the main AGRA plants), chemical pesticides, herbicides and fertilizers to farmers. The case of Malawi offers an

¹¹ *Ibidem*

eloquent example. With \$4.3 million, AGRA financed the Malawi Agro-Dealer Strengthening Programme (MASP), conceived by the American organization Cultivating New Frontiers in Agriculture (CNFA)¹², which is in turn financed by Gates. It is an entity that works to promote the private sector - from large corporations to small local entrepreneurs - as a strategy of choice for the spread and development of agricultural markets and the adoption of market-oriented solutions in agriculture¹³. The giant Monsanto is one of the main beneficiaries - if not the main beneficiary - of this programme. Monsanto's own country manager in Malawi has admitted that all of their herbicide and seed sales are channelled through the platform, with an 85% increase in 2007¹⁴ ¹⁵. Through its network of agricultural dealers, these giants thus become the only channel of training and information for African farmers who, absurdly enough, cease to be food producers and become consumers of goods, engines of a powerful agrochemical machine imposed, as in a new civilizing mission, by the private sector (according to World Bank reports in Malawi, Kenya and Uganda)¹⁶.

About 75% of seed supply in Africa comes from recycling and exchange between millions of small farmers from one year to the next but, as the African Centre for Biodiversity (ACBIO) reports, "a battle against the African seed system is underway"¹⁷. A concern shared to a large extent, also, by Action Aid. In a 2009 report, the NGO warns against AGRA's overly technical orientation, which completely ignores the complex social system of agricultural production on the continent. The report considers that there is a dangerous asymmetry in the field between small producers (with their seeds) and the multinationals involved in AGRA, with their monopolistic control over seed technology. Finally, it points out the decisive issue of intellectual property rights of seeds, and the transfer of local seeds to private individuals - as was the case in Zambia and Zimbabwe¹⁸.

That, in a nutshell, is the black box of philanthropy. While preaching about "boosting the productivity and income of smallholder farmers across the

continent"¹⁹, it is spreading opportunities for major economic interests, while undermining any in-depth analysis of African agriculture and respect for local practices and knowledge.

AGRA declares on its website that it embraces a model of participatory and self-determined development (home-grown), calling itself an "alliance led by Africans with roots in farming communities across the continent"²⁰. Too bad that there is no trace of indigenous participation at all.

"A dry seed pod of the *Moringa oleifera* tree", by T.K. Naliaka, is licensed under CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/deed.en>).

The Gates Foundation provides subsidies to biotechnological research programmes and uses this economic leverage to finance research circuits that have little or no participation. Farmers are merely recipients of technologies developed in laboratories and sold to them by large companies.

The critical voices on the continent were not long awaited²¹, however.

Taking advantage of the World Social Forum in Nairobi in 2007, a composite platform of African associations, immediately manifested their collective dissent against AGRA, the continent's largest industrial agricultural war machine.²²

The GMO case is in fact the other tricky issue²³. In 2007, AGRA released an official communiqué saying that GMOs are not currently part of its programs, but that they could become part of a long-term strategy if African governments would welcome the use of GMOs in their countries. The Rockefeller Foundation had already taken early action to clear the ground with governments, organizing the 'Biotech, Breeding and Seed Systems for African Crops', an initiatory meeting, where participants were given a substantial dose of presentations on GMO research in Africa, and on experiments already underway in the continent. A small consortium of very powerful corporations - Monsanto, Dupont and Syngenta - promptly engaged AGRA to promote this agenda and enter into agreements with several national research centers, so as to establish their activity in Africa with the irrefutable humanitarian excuse. It takes nothing to seduce African scientists by funding their research, convincing decision-makers by glorifying the benefits of GMOs and then imposing them on farmers, who will certainly have no say in the matter. AGRA recruits several of them, more or less well known. Among them the famous Kenya Agricultural Research Institute (KARI): now practically a subsidiary of Syngenta.

According to Bill Gates, GMOs are important innovations in the fight against hunger. Already in 2009, in a famous World Food Prize speech, he admitted that "some of our grants [in Africa] do include transgenic approaches, because we believe they have the potential to address farmers' challenges more efficiently than conventional techniques"²⁴.

On this basis, the foundation continues with relentless activism in financing the creation of new institutions. The African Agricultural Technology Foundation (AATF)²⁵, with 169 million dollars in funding over the last ten years, was created - so to speak - to instigate the illusion of African demand for GMOs. AATF acts as a broker between seed multinationals and the scientific communities of these countries to facilitate experiments aimed at developing GM monocultures, sold in the context of humanitarian programs such as Wema (Water Efficient Maize of Africa), and has the negotiating mandate on the management of corporate patents. It promotes food bio-fortification and the digitization of agriculture to bring "prosperity through technology" in the framework of the One Agriculture, One Science initiative²⁶: This involves forty-two African universities, working closely

²⁶ "One Agriculture-One Science': A New Partnership to Revitalize Global Agricultural Education ." | | ICRISAT | | *Press Releases 2014*. Last modified July 21, 2014. <http://www.icrisat.org/newsroom/news-releases/icrisat-pr-2014-media22.htm>

with the giants of the computer industry, starting with Microsoft. In just a few years, AATF has gained enormous importance. It is designed to expand the freedom of manoeuvre of companies, which actually have control over it²⁷, and at the same time it is accredited to participate in the definition of regional policies.

It therefore lobbies governments to persuade them to adopt biosafety laws - a prerequisite for the marketing of genetically modified products. Not surprisingly, the number of countries that have undertaken GMO research or cultivation has risen from 2 to 9 in less than a decade²⁸.

New institutions, new programmes that intersect and belong to the same core of monopolies²⁹. The thread of these processes develops through the classical patterns of the most invincible colonialist interference. AGRA has all the room for manoeuvre it needs in the domestication of governments, starting with financial lubrication. Through its policy and advocacy program, AGRA provides African governments with data collection and analysis on agricultural policies. It unleashes consultants and officials to formulate or reform national policies under the pretext of shaping "home-grown agricultural policies that provide comprehensive support to smallholder farmers"³⁰.

In this way AGRA avoids the risk of regulatory barriers in advance and adapts the laws of individual countries to its own objectives on issues such as seeds, soil quality, market access, land ownership rights, environmental regulations and digitization of processes. An interesting case in this respect is the reform of seed policies in Ghana in 2011, which allowed the introduction of GMOs and genetic research in agriculture (Ghana Biosafety Act 831)³¹. Similar pathways have been conducted in Egypt, Burkina Faso and South Africa, countries that have already completed GMO approval processes. In a network of synergies with other foundations and the corporate sector, the Gates Foundation's goal is to establish GMOs throughout Africa, with the blessing of multilateral institutions and national governments, in the name of food security by 2030³². It is no coincidence that Gates is one of the main financiers of the International Finance Corporation (IFC)³³, the right arm of the private sector within the World Bank, which commits 6% of its portfolio to support the agribusiness agenda. It calls for Sub-Saharan Africa to

³³ Curtis M., *Gated Development*, op. cit, p. 36.

"accelerate change on the continent"³⁴ AGRA is the powerful apparatus that consolidates this agenda. A rather irresistible form of market domination. Every scientific thought based on the recognition of the Earth as living nature is relegated to the rank of "a tradition to be emancipated", that is not science, if not even downright considered anti-science to be fought in the name of innovation.

Yet, contrary to the notion that it is industrial agriculture that feeds the planet, even today only 30% of the food comes from mega farms, and 75% of the corn and soya produced with monocultures are used for fossil fuels and animal feed. 70% is instead the result of the complex knowledge, the ancient and always new work of small farmers who cultivate biodiversity, develop better varieties, in a constant discipline of relationship between soil and food.

The scientific alternative to genetic engineering that inoculates toxic genes in food is agroecology, as recognized by the international IAASTD study³⁵. Food sovereignty, freedom from hunger, passes through this route. And this is the path towards justice.

GATES FOUNDATION'S GREEN REVOLUTION FAILS AFRICA'S FARMERS

Timothy A. Wise

In 2006, the Bill and Melinda Gates Foundation, the world's largest private foundation, endowed by the fortunes of technology monopolist Bill Gates of Microsoft, got lucky. Barely one year before the food-price spikes in 2007, the foundation launched a new agricultural development initiative to supplement its global health and education programs. Much of the initial funding came from investor Warren Buffett, awash in cash from the speculative bubble that would burst the following year. The Gates Foundation joined the Rockefeller Foundation to launch the Alliance for a Green Revolution in Africa (AGRA), which would prove to be their ready-made answer to the coming question: How can Africa grow more food?

AGRA's goals were ambitious: to double productivity and incomes by 2020 for 30 million small-scale farming households while reducing food insecurity by half in 20 countries. As with other BMGF initiatives, Western technologies would save the poor.

It is 2020, how is that Green Revolution going? AGRA has published no overall evaluation of the impacts of its programs on the number of smallholder households reached, the improvements in their yields and household incomes or their food security. It does not even make reference to those goals or progress in achieving them. Neither has the Gates Foundation, which has provided two-thirds of AGRA's funding roughly \$1 billion in funding. This lack of accountability represents a serious oversight problem for a program that has both consumed so much in the way of resources and driven the region's agricultural development policies with its narrative of technology-driven, input-intensive agricultural development.

My research shows that AGRA is failing on its own terms. There has been no productivity surge. Many climate-resilient, nutritious crops have been displaced by the expansion in supported crops such as maize. Even where maize production has increased, incomes and food security have scarcely improved for small-scale farming households, AGRA's supposed beneficiaries. The number of undernourished in AGRA's 13 focus countries has increased 30% during the organization's well-funded Green Revolution campaign.

The Gates Foundation prides itself on being a science-guided, data-driven, results-oriented philanthropy. On AGRA, it has spent two-thirds of a billion dollars. The results have been poor, which is all the more remarkable given that African governments have been persuaded to subsidize the purchases of Green Revolution seeds and fertilizers with up to \$1 billion per year in support. The Gates model for agricultural development is clearly flawed. Will the foundation recognize its failures and change course?

Failure to yield

As I document in my recent paper, "Failing Africa's Farmers: An Impact Assessment of the Alliance for a Green Revolution in Africa,"¹ and the related report, "False Promises: The Alliance for a Green Revolution in Africa,"² AGRA has received nearly \$1 billion in contributions and made over \$500 million in grants. I set out to fill the accountability gap as AGRA reached its self-declared 2020 deadline. Not surprisingly, AGRA declined my request to provide data from its own internal monitoring and evaluation of progress. That has been my experience with both BMGF and AGRA, that they are more image-conscious than results-oriented, more concerned with protecting a carefully crafted reputation than they are with

openly sharing and reflecting on their impacts. As a researcher, I have never gotten past the Communications Department at either institution.

In the absence of data on AGRA's direct beneficiaries and impacts, we used national-level data from 13 AGRA countries through 2018. We tracked trends in production, yield, and area harvested for most of the region's important food crops to assess the extent to which Green Revolution programs are significantly raising productivity. We also examined data on poverty and hunger to gauge whether there were signs that smallholder farmers' incomes and food security are improving across the region at levels commensurate with AGRA's goals of improved farmer welfare.

As Table 1 shows, we found no evidence that productivity, incomes or food security were increasing significantly for smallholder households. Specifically, we found:

- Little evidence AGRA was reaching a significant number of farmers. Its last progress report says only that AGRA had trained 5.3 million farmers in modern practices with "1.86 million farmers using" such practices. This is vague and far short of the stated goal of doubling productivity and incomes for nine million farmers directly and another 21 million indirectly.

¹ Wise, Timothy A. . "Failing Africa's Farmers: New Report Shows Africa's Green Revolution Is 'Failing on Its Own Terms.'" Global Development and Environment Institute - Tufts University, July 2020. Working Paper No.20-01. https://sites.tufts.edu/gdae/files/2020/07/20-01_Wise_FailureToYield.pdf

² Mkindi, A. R., Maina, A., Urhahn, J., Koch, J., Bassermann, L., Goïta, M., Nketani, M., Herre, R., Tanzmann, S., Wise, T. A., Gordon, M., & Gilbert, R. (2020). *False promises: The alliance for a green revolution in africa (Agra)*. Biodiversity and Biosafety Association of Kenya(BIBA), Brot für die Welt, FIAN Germany, German NGO Forum on Environment and Development, INKOTA-netzwerk e.V., Institut de Recherche et de Promotion des Alternatives en Développement (IRPAD), PELUM Zambia , Rosa Luxemburg Stiftung Southern Africa, Tanzania Alliance for Biodiversity (TABIO), Organic Agriculture Movement (TOAM). <https://www.rosalux.de/en/publication/id/42635>

- No evidence of significant increases in smallholder incomes or food security. For AGRA countries as a whole, there has been a 30% increase in the number of people suffering extreme hunger since AGRA began, a condition affecting 130 million people in AGRA countries. Kenya, home to AGRA's headquarters, saw an increase in the share of its people suffering undernourishment in the AGRA years.
- No evidence of large productivity increases. For staple crops as a whole, yields are up only 18% over 12 years for AGRA's 13 countries. Even maize, heavily promoted by Green Revolution programs, showed just 29% yield growth, well short of AGRA's goal of doubling productivity, which would be a 100% increase.
- Where technology adoption has taken place, input subsidies provided by African governments seem far more influential than AGRA's programs. It is difficult to find evidence that AGRA's programs would have any significant impacts in the absence of such large subsidies from African governments.
- Even where production increased, as in Zambia, a near-tripling of maize production did not result in reductions in rural poverty or hunger. Small-scale farmers were not benefiting; poverty and hunger remained staggeringly high with 78% of rural Zambians in extreme poverty.
- Green Revolution incentives for priority crops such as maize drove land into maize and out of more nutritious and climate-resilient traditional crops such as millet and sorghum, eroding food security and nutrition for poor farmers. Millet production declined 24% with yields falling 21% in the AGRA years.
- No signs of "sustainable intensification," the goal of sustainably increasing production on existing farmland. Environmental impacts are negative, including acidification of soils under monoculture cultivation with fossil-fuel-based fertilizers.
- Production increases have come more from farmers bringing new land under cultivation – "extensification" – than from productivity increases. Subsidies and other support programs encourage farmers to expand the cultivation of supported crops such as maize. This has implications for climate change mitigation and adaptation.

Rwanda: "Africa's Hungry Poster Child"

Rwanda, widely considered an AGRA success story thanks to rising maize production and yields, illustrates AGRA's failings. As the Table 2 shows, Rwanda's relative success in increasing maize yields 66%, with heavy subsidies and pressure from the government, came at the expense of sorghum, sweet potato, and other more nutritious crops. Area expansion was more responsible for production increases than were improved yields, as promised by the Green Revolution. Our more comprehensive measure of yield improvements for a basket of staple crops shows mediocre yield gains of just 24% over 12 years.

More telling, the increased production of maize has done little to improve the lives of Rwanda's small-scale farmers. The number of undernourished has increased 15% in the AGRA years. The national rate of extreme poverty has barely moved, from 63% before AGRA to 60% in 2018.

Most other AGRA countries have done even worse. Only Ethiopia and Ghana show any sign of dynamism in productivity growth while reducing the number of undernourished. As the Table 3 shows, most AGRA countries have seen only small productivity increases with rising numbers of malnourished people. AGRA's home country, Kenya, has seen a 7% decline in staple yields with a 43% increase in undernourishment.

Staple Yield Index: weighted yield increases for maize, millet, sorghum, roots/tubers. For AGRA total, Ethiopia, Nigeria, and Tanzania - cereals plus roots/tubers.

Time to change course

Rwanda's former Agriculture Minister, Agnes Kalibata, now heads AGRA. In a controversial move, the U.N. Secretary General named his Special Envoy to lead a planned U.N. World Food Systems Summit in 2021.

She is likely to bring her narrow Green Revolution perspectives to a discussion meant to address systemic failures in our food systems. The World Food Summit should instead actively consider agroecology and other low-cost, low-input approaches, which have shown far better short and long-term prospects than high-input Green Revolution practices. One University of Essex study³ surveyed nearly 300 large ecological agriculture projects across more than 50 poor countries and documented an average 79% increase in productivity with decreasing costs and rising incomes. Such results far surpass AGRA's.

AGRA and the Gates Foundation have had their chance to show that they could bring a Green Revolution of agricultural productivity and rising incomes to Africa's small-scale farmers. They have failed, even with the unprecedented levels of subsidies from African governments to entice farmers into buying Green Revolution seeds and fertilizers.

Many farmers' groups in Africa actively opposed AGRA from the start, pointing to negative environmental and social impacts of the first Green Revolution in Asia and Latin America. They have been proven right. Now it is time for the Gates Foundation, donors, and African governments to listen to farmers and shift their support to agroecology and other farmer-led, climate-resilient efforts to transform our food systems.

SEEDS OF SURVEILLANCE CAPITALISM: THE THIRD “GREEN REVOLUTION”

Navdanya

There is an illusion that running faster on the chemical and Poison Cartel treadmill, now equipped with Artificial Intelligence and Robots will be more effective in producing more food and feeding the hungry. On the contrary, the tools and technologies of the Poison Cartel have brought the planet and the lives of farmers to the brink with climate havoc, species extinction, water crisis, farmer incomes collapsing to zero and food related diseases killing larger numbers of people.

As Shoshana Zuboff, Professor Emerita at Harvard Business School writes in her book: “Surveillance capitalism is not a technology; it is a logic that imbues technology and commands it into action.”¹

And as John Hamer, managing director of Monsanto Growth Ventures (Monsanto’s venture capital arm) says: “if you think about it, there are only two people on earth that need to know a lot about remote sensing technology – Monsanto and the CIA.”²

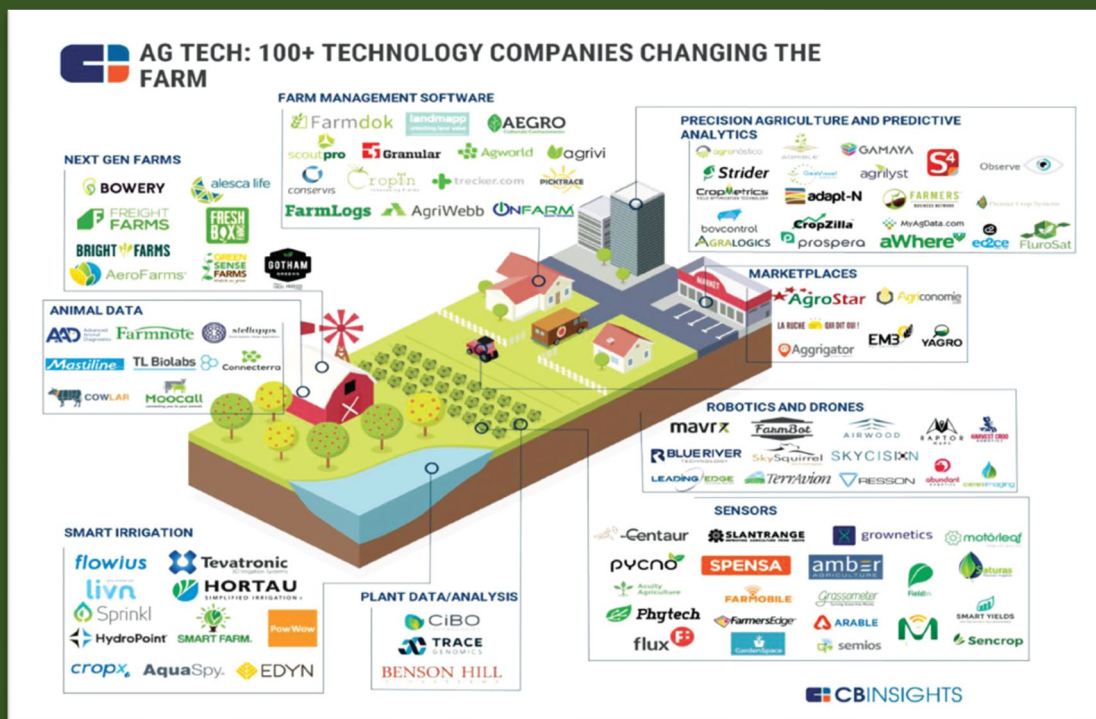

When technology is no longer seen as a tool to be assessed, chosen, adopted or rejected, but as a religion, as a civilizing mission, to be forced undemocratically on people, and when means for money making are elevated to human ends, beyond ethical, social, ecological and democratic assessment, we have re-colonisation in a modern garb. But then, as now, exterminating the diversity of life, of cultures, of knowledges, of economies, sovereignties, democracies through violence, for economic gain and political power has to be the objective.

Zuboff reiterates this in her book when she says “Surveillance capitalism is a rogue force driven by novel economic imperatives that disregards social norms and nullifies the elemental rights associated with individual autonomy that are essential to the very possibility of a democratic society.”

Surveillance capitalism refers to an economic system centred around the commodification of personal data with the core purpose of profit-making. Since personal data can be commodified it has become one of the most valuable resources on earth. It is a new mutant form of capitalism that uses tech for its purposes.

¹ Zuboff, S. (2019). The age of surveillance capitalism: The fight for a human future at the new frontier of power. Profile Books. Pg. 15.

² Trotter, Greg. (2016). Monsanto venture capital group brings tech-world approach to agribusiness. Chicago Tribune. Available at: <http://www.startribune.com/monsanto-venture-capital-group-brings-tech-world-approach-to-agribusiness/407653476/>

Source: CBinsights. 2017. *The Ag Tech Market Map: 100+ Startups Powering The Future Of Farming And Agribusiness*. Available at <https://www.cbinsights.com/research/agriculture-tech-market-map-company-list/>

The propaganda for surveillance capitalism is exactly the same that was used in the failed Green Revolution: “To feed the 9.7 billion people in the world in 2050, agriculture efficiency must increase by 35% - 70% and technology is the key. India’s rich mix of farming practices and small landholdings provide a massive data set to inform our models.”³ Smallholders and their farming practices have been reduced to a “data set” for surveillance capitalism that will “provide valuable insights for the agri industry, financial institutions, growers and policy makers.”⁴

Seeds of Surveillance: Surveillance Capitalism Enters Indian Agriculture

CropIn Technology Pvt. Ltd. a Bengaluru-based company has raised \$12 million in funding. It is funded by the Poison Cartel, Venture Capital Firms and Agtech companies like Chiratae Ventures, Bill and Gates Foundation, Strategic Investment Fund, Seeders Ventures Fund, Syngenta, Bayer and BASF. Its clientele includes PepsiCo, Mahindra & Mahindra, ITC, Field Fresh and McCain.

CropIn claims to use Big Data analytics, artificial intelligence and remote sensing to “analyze data” for 265 crops for agriculture processors, distributors,

³ Ahuja, A. 2018. CropIn Technology raises \$8 million from Chiratae Ventures, Gates Foundation. Livemint. Available at: www.livemint.com/Companies/X5TRE10YbgUlagvhN2IDBL/CropIn-Technology-raises-8-million-from-Chiratae-Ventures.html. Accessed on 20 August 2019.

⁴ Economic Times. 2019. SaaS-based agri-tech company CropIn registers 300% growth. Available at: <https://economictimes.indiatimes.com/small-biz/startups/newsbuzz/saas-based-agri-tech-company-cropin-registers-300-growth/articleshow/68147881.cms?from=mdr>. Accessed on 23 August, 2019.

inputs providers, lenders and insurers. The start-up claims to be building an “agri-information dataset” to detect patterns and “predict the future” of a variety of crops.

Source: <https://www.cropln.com/>

The company has a tie-up with the Department of Agriculture (DOA), Government of Karnataka, to “help” farmers create “more value” for their crops. The project aims to “assist” 4.15 lakh farmers across 30 districts of Karnataka in digitising 3.4 lakh acres of farmlands.

In 2017, Cropln started a project in collaboration with the Department of Horticulture (DOH), Andhra Pradesh, to digitize farms under two FPO in the districts of Chittoor and Krishna. It also works with the Bihar State Government and is part of the Jeevika project that uses “smart technologies” for climate resilient agriculture.⁵

Additionally, the World Bank has chosen Cropln as the technology partner in the public–private partnership project of the Government of India and World Bank.

Cropln is also partnering with the Government of Punjab’s department of agriculture and welfare to plan the certification and traceability of seed potato. Punjab Agri Export Corporation (PAGREXCO) has been reported to deploy blockchain technology with the help of barcode, QR code and geo-tagging to undertake certification and traceability of seed potato right from nucleus to seed level (harvest).

Furthermore, it has been reported that India’s agriculture ministry is working with National Informatics Centre on a 5 crore (50 million) rupee project which involves rolling out a software which will barcode all seeds. This has been justified on the grounds of making everything “more transparent” and “more traceable” and to “weed out poor quality seeds”. The seeds will be “tracked” throughout the

⁵ How Cropln is helping the farmer ecosystem. 2018. Available at: <http://smartceo.co/cropln-helping-farmer-ecosystem/>. Accessed on 28th August 2019.

supply chain. There are also discussions with state governments to adopt the same software. What is even more troubling is that 5,000 private seed companies have already come on board with this, profits of course being the motivation. The goal of this initiative, within two years, is to know how much of which seed is sold in which area.

However, it must be reiterated that farmers' community seed exchange of farmers' varieties has total reliability and transparency and there is no need for surveillance technologies to monitor and deny farmers' sense of quality and farmers' freedom.

It was recently reported that the 18,000-crore (180,000 million) seed industry has called for the introduction of a National Agricultural Policy and expedition of the 2019 Seed Bill and Biotech Regulatory Authority of India (BRAI) Bill to "ensure policy direction and predictability".⁶

The paradigm of seeds of surveillance is one of the combination of digital agriculture, data science and genetic engineering creating higher level of integration of abstractions and instrument for control. This is also why we see today that not only is the old toxic cartel recombining as a new one through mergers, it is moving beyond the convergence of seeds, pesticides and fertilisers to farm equipment, information technology, climate data, soil data and insurance.⁷

Seeds of Surveillance transform the knowledge and knowing from a participatory process of co creation with the earth, her biodiversity, her soils to take better care of the soil and the seed, based on seed and knowledge sovereignty into "data" for increased control over farming by the Poison Cartel, a continuation of the industrial food system, and the basis of an attempt at epistemic imperialism.

It is essential we resist these seeds of surveillance and defend the seeds of freedom.

SECTION 4

**ONE EMPIRE OVER FOOD:
FORCE-FEEDING US GMOs AND FAKE FOOD**

THE GMO EMPEROR HAS NO CLOTHES

THE GOLDEN RICE HOAX¹

Vandana Shiva

First conceived in the 1980s and a focus of research since 1992, genetically engineered vitamin A rice has been heralded on the cover of Time magazine in 2000 as a genetically modified (GMO) crop with the potential to save millions of lives in the Third World, proclaimed as a miracle cure for blindness²."

According to the UN, more than two million children are at risk due to vitamin A deficiency, which can cause vision impairment and lead to blindness. Is this golden rice really a miracle cure and the only means for preventing blindness in Asia? Or will it instead introduce new ecological problems just as the Green Revolution did, threaten biodiversity across Asia (Centre of Origin for rice crops)?

Despite unlimited resources at political, institutional, financial and corporate level, no reliable and stable vitamin A rice, that can significantly relieve the symptoms of Vitamin A deficiency in hungry people, has been produced in over 20 years of research³.

In 2018, according to an article by Allison Wilson, PhD and Jonathan Latham, PhD⁴, "the US Food and Drug Administration (FDA) has concluded its consultation process on Golden Rice by informing its current developers, the International Rice Research Institute (IRRI), that Golden Rice does not meet the nutritional requirements to make a health claim. [...] In an attached memo⁵, FDA notes the beta-carotene content of unmilled Golden Rice GR2E ranged from 0.50-

⁵ U.S. Food & Drug Administration. Biotechnology Notification File No. 000158 | Note to the File. May 8, 2018. <https://www.fda.gov/downloads/Food/IngredientsPackagingLabeling/GEPlants/Submissions/ucm607450.pdf>

2.35ug/g (FDA 2018a). That is, beta-carotene levels in Golden Rice are both low and variable. This compares to beta-carotene levels measured in non-GMO foods such as fresh carrot (13.8-49.3ug/g⁶); Asian greens (19.74-66.04 ug/g⁷); and spinach (111ug/g). FDA notes the mean value of beta-carotene for GR2E is 1.26ug/g. This is, paradoxically, less beta-carotene than the 1.6ug/g measured for the original iteration of Golden Rice (Ye et al. 2000)."

Moreover, when we consider the number of patents involved in this initiative, it becomes all too clear that the only beneficiaries of these supposedly 'people-led' ventures are large companies operating for profit – not for people⁸.

In 2011, the Bill & Melinda Gates Foundation resurrected this failed idea, by donating some US\$10.3 million dollars to IRRI (which BMGF heavily funds as part of the CGIAR system) for the development of Golden Rice⁹. When peasants started a Movement to Stop Golden Rice, Bill Gates gave free rein to the Gates funded Cornell Alliance for Science biased journalist Mark Lynas to distort the reporting in favor of golden rice. Through Lynas and the Gates PR for Golden Rice, misleading reports were spread, instead of what independent scientists and peasants actually had to say¹⁰.

Subsequently, in 2016, the Biotech PR lobby organised "Nobel Laureates" to promote Golden Rice and attack any criticism¹¹ from Civil Society Movements¹².

Despite strong opposition, a Golden Rice permit for 'Direct Use for Food, Feed and Processing' was issued by the Philippines' Dept. of Agriculture's Bureau of Plant Industry (DA-BPI) in December 2019. The Filipino Stop Golden Rice network immediately started a campaign¹³, and on August 7th, 2020, which is now celebrated as "No to Golden Rice Day", they released their statement "Why we oppose Golden Rice"¹⁴.

In 2000¹⁵, Navdanya had also started a campaign in India showing that there were superior and safer alternatives to genetically engineering vitamin A into rice¹⁶.

We read in goldenrice.org, that children under the age of 7 require 450 'units' of Retinol (Vitamin A) Equivalents. This means children would therefore have to eat 300gms of Golden Rice to get their daily requirement of vitamin A. In indigenous food cultures, a child's diet normally contains less than 150 gms of rice, but also contains a range of other nutritious foods grown by rural communities. In fact, Golden Rice is 350% less efficient in providing vitamin A than the biodiversity alternatives that nature has to offer.

Table 1: Traditional Indian food Sources of Vitamin-A and their β -carotene content:

| Source | Hindi Name | Content (microgram/100mg) |
|---------------------|----------------|---------------------------|
| Amaranth leaves | Chaulai Saag | 266- 1166 |

The Golden Rice HOAX

Profits from patents, not nutrition for children

1 What is Golden Rice?

Golden Rice is a genetically engineered rice with genes from **daffodils** and **bacteria** to produce 1.6 milligrams of Vit A in a kilogram of rice.

2 It will not alleviate Vitamin A Deficiency

Traditional Foods with Vitamin-A: Daily Value (%)

An adult will need to eat **2.272 Kilograms** of golden rice **everyday** to receive adequate Vitamin-A.

The transgenic rice plants must now be crossed with strains of rice that are grown locally and are suited to a particular region's climate and growing conditions. -ISAA.org

Source: ISAA

3 Trojan Horse

If approvals are given under a humanitarian guise, Syngenta can **commercialise** when they please. With the trait being crossed into local varieties of Rice, Syngenta can claim **ownership** over all those varieties in the future, for **their nutrition, climate resilience and their yield**. The yield of Golden Rice **does not** come from the 'Golden' trait. It comes from the plant the trait is put into. Engineering the Vitamin A trait into Rice is merely a means to establish

Intellectual Property Rights.

4 Golden Rice is not a Humanitarian Project

Syngenta owns **commercial rights**

to GoldenRice and has negotiated licences with other Corporations

5 Charity Cartel

The fraudulent philanthropy is a means to gain access and dodge anti-trust regulators. Rice eating cultures of the Global South must protect their food security and not allow a corporate takeover of the very basis of their survival.

SAY NO TO GOLDEN RICE

Will Gates destroy India's rich food cultures and Ayurvedic knowledge with GMOs and Fake Food?

Not only do these indigenous alternatives based on farmers' knowledge provide more vitamin A than Golden Rice at a lower cost, they also provide other nutrients.

Indeed, the first deficiency of genetic engineering rice to produce vitamin A is the eclipsing of alternative sources of vitamin A.

The lower-cost, accessible and safer alternative to genetically engineered rice is to increase biodiversity in agriculture. Further, since those who suffer from vitamin A deficiency suffer from malnutrition generally, increasing the diversity of crops and diversity of diets of poor people who suffer the highest rates of deficiency is the reliable means for overcoming nutritional deficiencies.

Even the World Bank has admitted that rediscovering the use of local plants and conservation of vitamin A rich green leafy vegetables and fruits have dramatically reduced vitamin A deficiency. Women in Bengal use more than 200 varieties of field greens.

Over 3 million people have benefited greatly from a food-based way of removing vitamin A deficiency by increasing vitamin A availability through home gardens. The higher the diversity crops the better the uptake of pro-vitamin A.

Environmental costs of Vitamin A rice

Tragically, sources of vitamin A in the form of green leafy vegetables are being destroyed by the Green Revolution and genetic engineering, which promote the use of herbicides in agriculture. For example, bathua, a very popular leafy vegetable in North India has been pushed to extinction in Green Revolution areas where intensive herbicide use is a part of the chemical package.

Vitamin A from native greens and fruits is produced without irrigation and wastage of scarce water resources. Introducing vitamin, A in rice implies a shift to a water-intensive system of production since so-called 'high yielding' rice varieties are highly water-demanding. Vitamin A rice will therefore lead to mining of ground water or intensive irrigation from large dams with all the associated environmental problems of waterlogging and salinisation.

WHY WE OPPOSE GOLDEN RICE

Stop Golden Rice Network (SGRN)

(Released in commemoration of the International Day of Protest Against Golden Rice, now in its 7th year)

Originally Published on August 7, 2020 in Independent Science News

The push for corporate-led solutions to hunger and malnutrition is alarming. In particular, Golden Rice is now being proposed as a solution to the worsening hunger and malnutrition associated with the pandemic. Agrochemical transnationals (TNCs) and collaborating institutions such as the International Rice Research Institute (IRRI) are using concerns over food security during the pandemic to push for an industrial agricultural system that is already discredited. To quote PAN Asia Pacific:

“in the webinar “The future of food systems in Southeast Asia post-COVID19” organised by IRRI and the FAO, Jean Balie, IRRI’s head of Agri-Food Policy, said that they are “looking to increase the mineral and vitamin content in rice grains” as a response to the pandemic, alluding to renewed promotion of the genetically-modified Golden Rice, which has recently been approved for commercialization in Bangladesh and the Philippines” said PANAP¹.

Golden Rice projects and applications are currently underway in three countries. On December 10, 2019, the Philippines’ Dept. of Agriculture’s Bureau of Plant Industry (DA-BPI) issued a Golden Rice permit for Direct Use for Food, Feed and Processing. This was despite the standing challenge² by farmers, scientists and civil society groups regarding Golden Rice’s unresolved safety and efficacy issues.

In August 2019, it was confirmed that Indonesia rice research centre (BB Padi) had grown Golden Rice in their testing fields in Sukamandi, West Java. But BB Padi is still awaiting permission from Indonesia’s biosafety clearing house for confined field testing in selected areas.

In Bangladesh, rumours have circulated that Golden Rice would be approved by the Biosafety Core Committee under the environment ministry last November 15, 2019. While there have been no specifics yet, proponents are optimistic that approval in Bangladesh will occur.

We, the Stop Golden Rice Network (SGRN), believe that Golden Rice is an unnecessary and unwanted technology being peddled by corporations purely for their profit-making agenda. Golden Rice will only strengthen the grip of corporations over rice and agriculture and will endanger agrobiodiversity and peoples’ health as well. Therefore, farmers, consumers and basic sectors have been campaigning against the propagation and commercialization of Golden Rice since the mid-2000s, utilizing various forms and actions, including the historical uprooting of Golden Rice field trials back in 2013.

Why is there intense opposition towards Golden Rice?

The importance of rice in Asian countries cannot be understated; 90% of rice is produced and consumed in Asia. Rice is at the center of the social, cultural and economic activities of peoples across Asia. It is also a political commodity as rice is the staple food for a majority of the Asian population. Asian countries such as the Philippines, Indonesia, and India are centers of origin of more than 100,000 varieties of rice. Also considered as among the most biodiverse countries in the world, a wide array of vegetables, fruits, root crops and cereals abound in the farms and forests of these countries, ensuring a dependable source of nutrition for the families and the communities.

Yet, malnutrition is prevalent, particularly among children and women. This is not simply because of the absence of an important nutrient or vitamin. It is caused by the “lack of access to sufficient, nutritious and safe food” due to poverty, and changing food production and consumption patterns (p. 27, UN FAO, 2017).

This impact is seen in IRRI's Green Revolution wherein many farmers across Asia have become bound to the expensive inputs and seeds peddled by huge agrochemical TNCs who promote a single-crop diet. As a result of green revolution, white rice has become dominant in once very diverse Asian diets; but white rice has a high glycemic index which causes diabetes and 60% of global diabetes cases are in Asia. Packing more nutrients, like Vitamin A, in rice, which requires more rice consumption would make this worse. Especially with the new pandemic for which diabetes is considered a risk factor for severity of Covid-19.

The United Nations Food and Agriculture Organization (UN FAO) identifies the dominance of large corporations over food systems as among the factors that contribute to food insecurity and malnutrition (p. 27, UN FAO, 2017³). In developing countries, large tracts of agricultural lands are being converted either to industrial and commercial land uses, or to large-scale mono-cropped plantations of cash crops such as pineapples, palm oil and bananas that hardly serve the nutrition needs of the people. FAO further acknowledges that the changes in food systems and diets, such

³ Ibid.

as the prevalence of highly processed foods and displacement of traditional foods and eating habits also contributes to the worsening trend of food insecurity and malnutrition.

Given this context, we assert that Golden Rice is simply a 'band-aid' solution to the wide, gaping wound of hunger and poverty. Worse, the issues that continue to hound Golden Rice further prove the point that it is unnecessary and unwanted

1. *Negligible beta carotene content* – The current version of the Golden Rice, GR2E contains a negligible amount of beta-carotene (from 3.57 ug/g to 22 ug/g), which the United States Food and Drug Administration (US FDA) also acknowledged, making the product useless in addressing Vitamin A deficiency (VAD) in contrast to existing and readily available food sources. Already minimal, Golden Rice's beta-carotene was also found to degrade quickly after harvesting, storing and processing, such as milling and even cooking unless the farmers vacuum-pack and refrigerate the GM rice. Farmers from developing countries, however, do not seal or store the paddy rice in vacuum packs, which will make the product more expensive. Electricity also remains scarce in remote farming communities so refrigerating the harvest is unrealistic bordering on the absurd.
2. *No meaningful safety tests have been done*⁴ – Even as the Golden Rice has been approved in the Philippines, there has been no testing done to ascertain if it is safe for human consumption. Meanwhile, the aforementioned beta-carotene degradation may result in toxic compounds causing oxidative stress damage which might lead to cancer. Dr. David Schubert of the Salk Institute for Biological Studies, USA and Dr. Michael Antoniou of King's College London, state that "*there have never been short nor, more importantly, long-term safety testing in laboratory animals (of Golden Rice) and this must be done for several generations in rats to determine if it causes birth defects, which we consider a serious possibility.*"
3. *Contamination of other rice varieties and wild relatives of rice* – Field trials conducted so far have only looked at the agronomic traits of Golden Rice, and not its long-term effects on the environment, including its possible effects on the genetic diversity of the thousands of rice varieties being cared for by small scale farmers and indigenous peoples. While rice is a self-pollinating crop, cross-contamination is still inevitable. Contamination can also occur through seed mixing. Such contamination has already happened in the US with the Liberty Link rice scandal back in 2006 that caused US farmers millions of dollars in losses because of the inadvertent contamination of the yet unapproved GM rice.
4. *Safer sources of beta-carotene* – Being some of the mega-diverse countries, vegetables and fruits that are high in beta-carotene are found in abundance in the Philippines, Indonesia, Bangladesh, India and other target countries for Golden Rice. These foods are available and accessible for the people and contain much higher levels of beta-carotene than Golden Rice.

⁴ Medina, Charito P. "Comments Regarding Consolidated Report of PHILRICE and IRRI's GR2E Rice Application for Direct Use as Food and Feed, or for Processing," October 16, 2019. https://bioscienceresource.org/wp-content/uploads/2020/03/Golden-Rice_DFFP_Medina-comments.pdf

The worsening land-grabbing and land conversion cases, liberalization of agricultural commodities and increasing control of corporations over agriculture and food, however, are preventing farmers and their communities from having access to these safe and nutritious foods. In developing countries, the challenges described above remain the main culprit of food insecurity and malnutrition. Both the development of biofortified crops like Golden Rice for solving health issues and corporate led projects in agriculture as ways to ensure food security represent a worrisome push for top-down and anti-diversity approaches to food and health that will ultimately undermine people's capacities to strengthen their local food systems. By emphasizing dependence on just a few market-based crops biofortification actually promotes a poor diet with little nutritional diversity

A demonstration against Golden Rice, Manila Photo: Ryan Damaso/MASIPAG

Golden Rice is a failed and useless product, and that is why we continue to resist and oppose it. Time and again, huge agrochemical companies, philanthrocapitalists and pseudo-public agencies have done everything in their power to deny the people's right to participate in decisions about their food and agriculture. Already, zinc and iron GM rice and thirty other GM rice are in the pipeline, with Golden Rice serving as the Trojan Horse to lure the people into social acceptance and false security.

More than resisting the release of Golden Rice however, we are pushing for safer, better and healthier alternatives to addressing VAD and other malnutrition issues. VAD and other malnutrition problems can be mitigated and addressed by having a diverse diet. Nutrition does not need to be an expensive commodity, nor rely on advanced technology. We believe that instead of pushing Golden Rice and biofortifying crops through genetic modification, governments should promote biodiversity in farms and on tables by supporting safe, healthy and

sustainable food production. We are also calling on governments to pay attention to the needs of our food producers, including facilitating access to lands to till, appropriate technologies and an agriculture policy that will promote and uphold the people's right to food and the nations' food sovereignty.

INDIAN MINISTER OF ENVIRONMENT HEEDS PUBLIC CALL FOR A MORATORIUM ON BT BRINJAL

Navdanya

Since the mid-2000s Big Agribusiness had been pushing for the introduction of Bt Brinjal in Bangladesh and India concurrently. It was approved for commercialization in India in 2009, but - after public outcry and rounds of debates, a moratorium on Bt Brinjal was passed by the Indian government in February 2010. Introducing a ban that is in place until today. On the other hand, Bt brinjal was approved for commercial release in Bangladesh in 2013¹.

In February 2010, after nearly a month of public hearings, protests, and nationwide debate², India's Environment Minister Jairam Ramesh announced an indefinite moratorium on the sale of Bt Brinjal (genetically modified eggplant). Cleared for commercialisation in October 2009 by India's Genetic

Engineering Approval Committee (GEAC), Bt Brinjal has been met with tremendous resistance by farmers, consumer advocacy groups, medical experts, and environmentalists. A number of state governments, which in India's federal system have the final say on agriculture, had also expressed apprehension about the product.

The moratorium on Bt Brinjal in India was a milestone in the global movement for GMO-free agriculture.

Dr Vandana Shiva has likened India's struggle for GMO-free agriculture to Mahatma Gandhi's movement for independence. "Opposing Bt Brinjal is as much a fight for our food as it is our freedom. When the British Raj imposed the salt law to establish a salt monopoly, Gandhi started the Salt Satyagraha. When corporations like Monsanto impose GMOs to establish seed monopoly and control our food, we are forced to declare a Seed Satyagraha. GMO-free, biodiverse, organic agriculture is the satyagraha of our times."

BT BRINJAL: ALLIANCE FOR CROOKED SCIENCE & CORPORATE LIES

Farida Akhter

Introduction

Brinjals, locally called *Begun* (in Bangla) by the people of Bangladesh, are the most common and favourite vegetable. On 17 May 2020 the *New Age*, a national daily of Bangladesh, published an article of mine [Akhter, 2020] titled “Aubergine Story: Local varieties exist, not GMOs”. In the article, I argued that in the month of Ramadan (month long fasting of the Muslim communities), the demand for brinjal (eggplant/aubergine) is the highest, because it is the main component of the most popular *Iftar* item, the *Beguni*. From the rich to the poor, *Iftar*¹ is incomplete without *chola-peyaju-beguni* on the plate. In the market, local varieties of brinjals were amply seen, but not Bt brinjal, although claimed by the promoters that smallholder farmers have rapidly adopted the crop, from just 20 in 2014 to more than 27,000 in 2019 across all districts of Bangladesh [Conrow, 2019].

The article referred to a UBINIG quick survey over telephone in April-May 2020, with farmers in eight districts and consumers in Dhaka to investigate how farmers were faring during the COVID-19 Lockdown period with the marketing of brinjals. These were sold for prices ranging from Tk 35 to Tk 80 a kilogram on the market. In early May, at least 26 different local varieties with beautiful names, specific to their agro-ecological locations, were found on the market. The prices of HYV brinjals were between Tk 25 - 50, and that of hybrid was Tk 45–55 per kilogram. Commercial farmers grow the HYV varieties on a large scale while the small farming households grow local varieties on a smaller scale in their small pieces of land. Interestingly, they are readily available on the market and have a good demand. Local varieties fared much better than the high yield varieties (HYVs) and hybrid varieties.

Jessori Begun

Shoila Begun

Jhumka-Sada

¹ *Iftar* (Arabic: إفتار, 'break of a fast'), is the evening meal with which Muslims end their daily Ramadan fast at sunset.

Bt brinjal seeds (Bt brinjal 1, 2, 3 and 4) for the winter season were given to farmers in different areas during the period of December 2019 to January 2020. If the claim of International Food Policy Research Institute (IFPRI) and the ministry of agriculture that 27,000 smallholding farmers were cultivating Bt brinjal across all districts of the country is true, then it is reasonable to expect that the new genetically modified crop would have grown enough in quantity to be visible in the market. The markets in eight districts and in Dhaka showed no presence of any Bt brinjal in late April–early May 2020. None of the sellers in the market could identify any Bt brinjal in their stock. None of the buyers interviewed in the Dhaka market could identify any aubergine which would be a GMO.

Could it be that they were in the market without any label? In that case, it is a clear case of violation of approval conditions of Bt brinjal in the country. We know that in October 2013, the National Committee on Biosafety (NCB) imposed seven conditions to be followed in field cultivation of the four Bt brinjals (1,2,3 & 4) One of these conditions was labeling — if Bt brinjal is brought to the market, it must be labeled, i.e., it should be clearly stated that it is GMO. But the Director General of BARI, Dr. Rafiqul Islam Mondol only agreed to label the sacks as 'poison-free GM brinjal' [Akhter, 2016], which was also not followed.

Source: *Bangladeshe Adhunik projuktir bt beguner jat udbhabon O utpadon projukti*, BARI, USAID, ABSPII & Cornell University, 2014

Culturally, farmers have the tradition of naming the brinjals they grow with beautiful local names such as Hingla begun, Batka begun, Tal-begun, Kalo-khato begun, Laoitta begun, Sailla begun, Ghritakanchan begun, Nayantara and many others. Brinjal (*Solanum melongena* L.), also known as aubergine or eggplant) is one of the most common and important vegetables. It is an important solanaceous crop of the subtropics and tropics. In this rich diversity of brinjals, Bt brinjal is now a 'bejat' name in the list of hundreds of diverse varieties of aubergine in the country, because these are numbered like prisoners and are called Bt

brinjal 1, 2, 3 and 4. The word 'bejat' expresses the displacement in the order of crop varieties implicating potential harm to agriculture, food system and culture. In 'bejat', the original names of source materials have disappeared. Local names of brinjals are always related to specific agro-ecological conditions where a variety could express their natural genetic traits. But Bt brinjal seeds are given to

different geographical locations assuming a homogeneous agro-ecological environment where they do not belong. Now it is harder to decide where they belong, except in the gene-manipulating laboratories. Farmers cannot feel or determine any agro-ecological, culinary or cultural connections to laboratory varieties, such as for growing these brinjals. Therefore, farmers who received the seeds, having not being told the real name of the introduced Bt brinjal, called genetically engineered varieties as "Sarkrari Begun" or the "government brinjal".

The genetically modified Bt brinjal has been developed by inserting a gene *cry1Ac* from a soil bacterium called *Bacillus thuringiensis* through an *Agrobacterium*-mediated gene transfer. Four Bt brinjals are distributed to farmers for field cultivation. The original names of the varieties that had been selected for transgenic manipulation are Uttara (Bt brinjal-1), Kajla (Bt brinjal 2), Nayantara (Bt brinjal 3) and ISD-006 (bt brinjal 4). These are some of the most popular commercial varieties as well and they are also grown as non-Bt varieties. There are elements of deception in Bt brinjal field trial in selecting the most popular varieties; if farmers accept any transgenic variety, it could be claimed that genetic manipulation is a commercial success. But farmers' varieties, selected over hundreds of years, are already successful and proof of the brilliance of the farmer's knowledge. Genetic manipulation is merely a trick for appropriation of farmer's knowledge.

Bangladesh has been a target country for the Bt brinjal under the Agricultural Biotechnology Support Project II (ABSP II). The introgressions of Bt gene into 9 Bangladeshi local variety brinjals were done at MAHYCO, (Maharashtra Hybrid Seed Company) the Indian company, using their lab facility. MAHYCO has received the application rights of the Bt *cry1Ac* gene technology from US company Monsanto which has a 26 per cent stake in Mahyco-Monsanto Biotech (MMB). The Bangladeshi varieties were backcrossed at MAHYCO with transgenic brinjal containing *Cry1AC*. This means that there was hardly any scope for knowledge and technology transfer from MAHYCO's proprietary technology to the scientists working in public research institutions of Bangladesh. The Bt brinjal is actually a piracy of the local variety brinjals to be genetically modified for patenting by Monsanto-Mahyco partnership.

Under ABSP II, the three country partnership arrangement was extended to the Indian Institute of Vegetable Research, Varanasi, University of Philippines in Los Banos, a government research institute Bangladesh Agricultural Research Institute (BARI) and a private seed company, East West Seeds, Bangladesh. The ABSP II is funded by USAID and led by Cornell University, USA.

On 25 May, 2020 *Frontiers in Bioengineering and Biotechnology* published an article based on a 2019 study on Bt brinjal claiming that 83.1% of Bt brinjal growers were satisfied with the yields obtained, and 80.6% were satisfied with the quality of fruit, while 58.7% non-Bt brinjal growers were satisfied with their yields and 28% indicated that a large portion of their fruit was infested. Among the non-Bt brinjal growers, 39.6% had not heard of Bt brinjal [Shelton, et. Al 2020]. Another article was published on 28 May, 2020 in the *Cornell CALS*, by Joan Conrow which referred to the same article published on May 25, 2020 in the *Frontiers* making a

conclusive statement that “farmers in Bangladesh achieved significantly higher yields and revenues by growing insect-resistant, genetically engineered eggplant”. However, the article quotes Maricelis Acevedo, Director for the Feed the Future South Asia Eggplant Improvement Partnership, “This study provides more evidence that Bt brinjal is being accepted in the market, but more work is needed to develop new varieties better adapted to local conditions and market preferences ” [Conrow, 2020]. It looks like they do not have updated information on the Bt brinjal farmers' performances in this year; it was simply a deceptive tactic using previous studies with newer headlines. The question remains, why are they not visible in the market?

Cornell University & Bt brinjal “success” lies

The Cornell Alliance for Science was launched in 2014 with a \$5.6 million grant from the Bill and Melinda Gates Foundation to “add a stronger voice for science and depolarize the charged debate around agricultural biotechnology and genetically modified organisms (GMOs)” [CCR, 2015]. Cornell University is home to the controversial Cornell Alliance for Science, which is publicizing the Bangladesh Bt brinjal project. Its partners include the GMO industry group ISAAA, which is funded by Monsanto, CropLife, and Bayer. Cornell gave Mark Lynas a Visiting Fellowship and a platform to voice his pro-GMO views. Lynas now promotes GMOs “to the exclusion of almost everything else”. Cornell paid his travel expenses to the Philippines to write a pro-GMO article [GMW, 2015]

The role of Bangladesh Agricultural Research Institute (BARI) from the beginning was guided by the ABSPII project guidelines, and it had to provide its Regional research stations for Field Testing and later on to get formal government approval for commercial cultivation in the farmer's field. Started back in 2005 it took seven years to complete greenhouse trials. The national bio-safety committee approved the contained field trial of Bt. Brinjal in 2007-08 [Ahmed, 2013].

However, the results of the contained field trial were not shared with relevant stakeholders before it was allowed for Open Field Trial. Later, Open-Field Trials of Bt brinjal were conducted in various agro-ecological zones in the country for local adaptability of the crop. From the beginning, the field research was conducted by BARI/USAID/ABSPII and Cornell University. Monsanto hardly appeared on those signboards, as all the signboards were in English. As the implementing agency, it said: Biotechnology Division, BARI, Gazipur ARS, USAID, ABSP-II & Cornell University [UBINIG, 2013].

There were also Danger signs for GMO field testing!

Danger Signboard on the Research Station Field

This Confined Trial is for research only
 Not Approved for Human food or Animal Feed
 Entrance is restricted
 AUTHORISED PERSONNEL ONLY

But fencing in all the Research stations was hardly strong enough to restrict entrance of the public.

The role of the government was limited to getting approval from the National Committee on Biosafety (NCB) under the Ministry of Environment & Forest (MOEF) as recommended by the National Technical Committee on Crop Biotechnology (NTCCB) under the Ministry of Agriculture. The report of the performance of the Field Trials in the BARI research stations was never published nor is there any reference to it. UBINIG's investigation in the six regional stations of

BARI showed that the trials were not very satisfactory {UBINIG, 2013}.

In a notification (in bangla) of October 30, 2013 bearing a reference No.22.00.0000.073.05.003.2012-271 the Environment Section-2 of the Ministry of Environment and Forestry provisionally approved the petition of BARI to cultivate Bt Begun varieties 1,2,3 and 4 in a limited scale at the field level with seven conditions. One of the conditions was for the applicant organization to take effective measures by labeling so that Bt Brinjal can be marketed as per Biosafety Rules. The Ministry of Agriculture till now, has not taken any such measure.

Strategies of Cornell University to promote Bt brinjal

Attracting the top leadership of the State- The Prime Minister

Ronnie Coffman, Director, Cornell University (left), Prime Minister Sheikh Hasina Wazed (middle) and Minister for Agriculture Matia Chowdhury (Right)

In May 2015, Cornell University Visiting Director, Ronnie Coffman, honored Prime Minister Sheikh Hasina with a citation at her office on behalf of the university's president David J Skorton. The citation signed by the president of the university read: "*Prime Minister Sheikh Hasina's continuous support for the improvement of agriculture sector in Bangladesh and attain self-sufficiency in food production as well as her keen interest in promoting science and technology.*"

Ronnie Coffman of Cornell University informed the Prime Minister that the new variety of the brinjal can withstand pest attacks and hence can be free from pesticides. Sheikh Hasina thanked Cornell University for the innovation of Bt brinjal [NTV, 2015].

Lies & False Claims

Although Bangladesh Agricultural Research Institute (BARI) is the responsible government institution in conducting the research and monitoring field cultivation, unfortunately it hardly provides information on the success or failures of Bt brinjal. For example, there is no information on BARI's website (www.bari.gov.bd). The Department of Agricultural Extension (DAE) which is responsible for distributing the Bt brinjal seeds to the targeted farmers, also has no information on their website (www.dae.gov.bd). They did not have to do any promotion of Bt brinjal, nor come up with any performance reports. No report has been published as research findings of the first two rounds of field cultivation except some propaganda

campaigns. Even the International Service for the Acquisition for Agri-Biotech Applications (ISAAA) did not publish any report after its Brief 47: The Status of Commercialized Bt Brinjal in Bangladesh, in 2014. There is nothing reported in 2015 about the so-called success of the second round of field cultivation. In the second round, Bt brinjal seedlings were given to 108 farmers, of which 79 farmers were interviewed and were found to have had massive failures [UBINIG, 2015].

For Cornell University, despite having big named scientists and propaganda journalists like Mark Lynas, it was not very easy to establish the claims of the so-called success of Bt brinjal cultivation in Bangladesh. Farmers' organizations like Nayakrishi Andolon, research organizations like UBINIG, environmental activist groups and individual activist journalists always had different reports published before and after the approval of Bt brinjal. Field areas including farmers fields were followed up and farmer's experiences of failures were documented. Repeatedly UBINIG and Nayakrishi proved that the so-called claim of success has no scientific and empirical basis. Till today, the promoters of GMOs failed to produce any scientific evidence that Bt-brinjal field trials were successful, nor could they show farmers had adopted their transgenic varieties. The false claims of successes were, hence, challenged.

The International Food Policy Research Institute (IFPRI) also undertook a study under the behest of the Ministry of Agriculture with 1200 farmers in 2018; the report was released in 2019 [Ahmed, 2019].

False Claims on Economic Gains

The IFPRI study findings claimed, "farmers, who cultivated the GM versions gained by 55 percent higher income compared to their peers growing the non-Bt brinjal" by over Tk. 30,000 per hectare. [IFPRI, 2019]

In Bangladesh the majority of farmers (84%) belong to small households, owning less than a hectare of land, and only 14% households have over a hectare to 3 hectares [BBS,2014]. Brinjal farmers are mostly small-scale farmers and allocate land to brinjal farming which is less than a hectare. Bt Brinjal farmers also fall into this category. In a UBINIG study (2019) 71% of farmers receiving Bt Brinjal seeds were small scale farmers and only 25% farmers were middle farmers. However, they do not allocate all the land they own for brinjal farming and also not to Bt Brinjal farming. In the initial round of Bt brinjal farming (2015-16), 33 farmers (89%) out of 37 allocated 33 decimals of land, i.e. less than one-third of an acre for Bt brinjal. The land allocated by the farmer for Bt brinjal cultivation varied by number of seedlings given and therefore it was found that the allocated land was between 4 decimals to 38 decimals. The land was selected and the amount was determined by the DAE official himself [UBINIG, 2019].

UBINIG field investigation showed a farmer cultivating Bt brinjal 2, and Bt brinjal 4 in a land of 33 decimals incurred a loss of Tk. 30,000, and another farmer had a loss of Tk.25,000 [Jony & Sobhan, 2016]. Showing there is hardly any basis for IFPRI's claim.

False Claim: Bt brinjal is Pesticide-free

Bangladesh is a country of a wide range of varieties/cultivars of brinjals. Bangladesh has at least 248 indigenous varieties of brinjals. Most of the varieties are resistant to major disease and pests. The major pests of brinjal include insects, mites, fungi, nematodes and bacteria. The fruit and shoot borer (*Leucinodes orbonalis*), for example, is one of the insect pests of brinjal. Some of the local varieties including Jhumka 1, Jhumka 2 are highly resistant to fruit and shoot borer; while, Islampuri 3, BL 34, Muktakeshi are fairly resistant, Singnath long and Singnath 4 are tolerant to brinjal shoot and fruit borer [Mannan et. al 2003].

Promoters claim that Bt brinjal is pesticide free. It is called “**Poka bihin begun**” (no-pest brinjal) meaning that it does not require use of pesticide for the most common pest, the Fruit and Shoot Borer (FSB). Therefore, GM crops are claimed to be safe because they do not need applications of a huge amount of pesticides. Interestingly, the IFPRI study did not claim ‘no use of pesticides’, but claimed there was 39 percent reduction in the quantity of pesticides applied and 51 percent reduction in the number of pesticide applications [IFPRI, 2019]. Although the major promotional message to the farmers was Bt brinjal does not require any application of pesticides and not merely reduction in the use of pesticide.

But the UBINIG field study found a different reality. The farmers had to use huge amounts of pesticides recommended by the supervising authorities of BARI and DAE. These included Comfidor, Ektara, Admasar, Dithane M-45, Bavistin, Thiovit, Basudin, Furadan, Borax, Demsa granular, Vim powder, Admire, 200sl (Bayer crop science), Bleaching powder, Heckel, Salclox, Diazinon etc. among the many other Insecticides and Fungicide sprayed, as provided by DAE. In the booklet distributed to some of the farmers, they recommended organic pesticides such as Neem seeds, Neem oil, powder soap, and Trix. Among the chemical pesticides Malathion, Omite, and Bavistin were suggested for different pest/disease attacks. It seems that in real situations, the supervising authorities were giving more pesticides than those recommended because of the different kinds of pest attacks.

In the field investigation of Bt brinjal's second round of field cultivation, pesticide use was more prominent than in the first round. Different pesticides were used several times, beginning from transplanting to growth, development to bearing and harvesting of fruits. The major pests observed in the Bt brinjal field included viruses, fungi, insects and mites. The virus infection included tulshi virus and mosaic virus. The fungi appeared as root rot, stem rot, wilting, leaf spot and fruit rot. The insects included aphids, leaf curlings, whiteflies, sucking insects, fruit and shoot borer, red mites, and many others. Thirty-five types of pesticides including acaricide, insecticide and fungicide were sprayed several times in the Bt brinjal fields, as per the directions of the supervising officials.

Five banned insecticides including Basudin, Bidrin, Darsbun, Diazinon and Furadan were used in different Btbrinjal fields. Thirty other pesticides used were not

from the list of 76 pesticides recommended for brinjal crop production in Bangladesh [UBINIG, 2015].

Hiring Liars and Propagandists Instead of Evidence-based Research

Mark Lynas is a frequent contributor and researcher at the Cornell Alliance for Science visited Bangladeshi Bt brinjal farmers, along with various scientists and others from Cornell University and the Bangladesh Agricultural Research Institute. His organized visit was aimed to make everything successful. He tried to counter the reports written by the Bangladeshi journalists [New Age, 2014] as false! He visited the same Bt brinjal farmer and found (!) the crop in good health and the farmer happy [Lynas, 2014].

Media attention to Mark Lynas is generated by mostly the drama he draws from his own life. He claims, his life begins as "the first anti-GMO activist in the world", but ends as an avid GMO supporter, desperate to make amends for the movement he started. Bill Gates' Foundation has set up a position for Mark Lynas at Cornell, as part of the controversial Cornell Alliance for Science. This allows Lynas to do paid promotion for GMOs "to the exclusion of almost everything else" [GMW, 2015].

In the response to the article, published as a letter to the Editor on 4 May, 2015, Anne Lappe of Small Planet Institute said "Mark Lynas profile of one farmer in Bangladesh does not represent the facts on the ground about the genetically engineered eggplant there. The trials of the new variety of eggplant have actually had very poor results: genetic engineering did not protect plants from most pests and have led to crop loss and debt for farmers". Also she revealed that "Mr. Lynas' Bangladesh visit was organized by the new Cornell Alliance for Science, funded by a \$5.6 million grant from the Gates Foundation, that is promoting biotechnology, not dispassionately reviewing the science" [Akhter, 2015].

BBC Panorama: A Scandalous Promotion of Bt brinjal

BBC Panorama's programme, 'GM Food: Cultivating Fear', aired on 8 June, 2015 featured the pro-GMO campaigner Mark Lynas visiting an insecticidal Bt brinjal field in Bangladesh and enthusing about the performance of the crop, claiming 90% success for this controversial GM crop. The presenter Tom Heap, and his friend, GMO promoter Mark Lynas, had grossly misrepresented the so-called success of the brinjal crop.

Faisal Rahman, staff correspondent for the United News of Bangladesh (UNB) and the author of the report titled '*Bt brinjal turns out to be 'upset case' for farmers'* based on field visits and telephone interviews with farmers growing Bt brinjal in the second year Bt brinjal cultivation, challenged that there is no evidence to support the claim.

Faisal Rahman's report concluded that "*The cultivation of genetically engineered Bt brinjal in the country's several districts has cost the farmers their fortunes again this year as the plants have either died out prematurely or fruited very insignificantly compared to the locally available varieties.*" His evidence,

together with subsequent investigations by GMWatch, casts serious doubt on the credibility of the BBC Panorama programme [Robinson, 2015].

BBC Panorama featured the so-called success story of a farmer Hafizur Rahman, who was visited by Mark Lynas before. Lynas claimed that the Bt brinjal had "nearly doubled" productivity and that Hafizur Rahman had been able to sell the crop labelled "insecticide free". Lynas concluded, "Now, with increased profits, he looked forward to being able to lift his family further out of poverty." But after tracking down farmer Hafizur Rahman, UBINIG found almost every element of the Lynas narrative was misleading or false.

Visiting Hafizur Rahman UBINIG found that far from being a poor farmer that the GM crop is helping to lift out of poverty, as Lynas claimed, Hafizur Rahman is actually "a Polytechnic Graduate" and "well off commercial vegetable farmer". And the story about the GM crop enabling him to dispense with agrochemicals was far from the truth – multiple chemicals, including pesticides, were used on the crop. The farmer also complained that the Bt brinjal had a "rough surface and gets soft very quickly", unlike the traditional variety which is "shiny and remains fresh for a longer time" [GMW, 2015].

Two complaints were lodged to the Editorial Standard Committee (ESC) of the BBC Trust that its Panorama film '**GM Food: Cultivating Fear**'², broadcasted in June 2015, was biased and inaccurate and that it '*misled the audience by making a claim of success for a GM aubergine crop which is not supported by the evidence*'. BBC failed to provide sources for the 90% success rate and only referred to Dr Frank Shotkoski, director of the Agricultural Biotechnology Support Project II (ABSP II) programme at Cornell University [GMW, 2015].

Conclusion

Bt brinjal started with Monsanto as a proprietary owner of the technology, but the real game was played by ABSP II of USAID and the Cornell University backed by Bill Gates Foundation. Fortunately, Bangladesh land and environment has rejected the seed. It simply does not grow or give fruits. That's why they need propagandists like Mark Lynas and the so-called scientists to prove the 27,000 farmers of Bangladesh are happily (!) cultivating Bt brinjal.

And of course, you need Bill Gates to fund blatant lies, crooked science, commercial propaganda and destruction of agriculture and biodiversity of countries like Bangladesh.

LAB MADE BREAST MILK AND LAB MADE MEAT

Vandana Shiva

Technologies are tools and they need to be assessed on ethical, social and ecological criteria as well as in the context of contributing to the wellbeing of all.

The Biodiversity of the soil, of the plants and our gut microbiome is one continuum.

Today, most people are now aware that what you eat directly affects the state of your health. As countless studies have shown, industrial chemical-based food is a major contributor to ill health and a root cause of disease¹.

Despite this, rather than shifting to ecological food and agriculture - which works in alignment with the laws of nature and the ecology of our bodies, Big Tech and the billionaires, with Bill Gates leading the way, are now investing in hyper-industrial food developed in laboratories, beginning with breast milk.

Our first food is milk from the breast. Breast feeding is a living relationship, it is an ecological, biological activity, which deepens the bond between the mother and baby. Breast milk contains all the nutrients for neural development and creates immunity to many diseases. Nutrients and antibodies are passed to the baby, while hormones are released into the mother's body².

Breast milk is not a product which can be substituted with industrial products, artificially made in factories and laboratories.

Artificially created milk lacks the many natural benefits found in breast milk. UNICEF estimates that a formula-fed child living in disease-ridden and unhygienic conditions is between 6 and 25 times more likely to die of diarrhea and four times more likely to die of pneumonia than a breastfed child³.

The mechanized and industrialized vision of society promoted by big business and the industrial Baby Food industry has eroded the culture of breast feeding, particularly in the western world. The International Breast Feeding Action Network⁴ was created primarily aimed at Nestle, the world's leading producer of food for infants.

⁴ "IBFAN – International Baby Foods Action Network," n.d. <https://www.ibfan.org/>

Concern that the dramatic increase in mortality, malnutrition and diarrhoea in very young infants in the developing world was associated with the aggressive marketing of formula for breast milk substitutes, in May 1981 the WHO International Code of Marketing Breast Milk Substitutes passed by 118 votes to 1, the US casting the sole negative vote⁵.

Despite the known hazards caused by breast milk substitutes and notwithstanding regulations, the race for developing substitutes for breast milk has intensified.

Bill Gates' climate change investment firm, Breakthrough Energy Ventures, has invested \$3.5 million into "Biomilq"⁶ which is targeting infant nutrition by attempting to reproduce mother's breast milk in a laboratory as a solution to climate change! No surprise of course that there is a patent pending for Biomilq⁷.

Photo: evilpeacock/flickr

The explosion of chronic diseases with the increase in factory farming and industrial food production and processing has already shown that artificially produced food is neither good for people's health nor good for the planet's health.

Those who are contributing to the collapse of the planet and of our wellbeing have joined hands in creating hyper-industrial toxic diets in the name of protecting our health and saving the planet.

The creation of **the Impossible Burger** is a case in point.

The "Impossible Burger", based on vast monocultures of GMO Roundup-sprayed soya cannot be considered a "safe" option, both for its high levels of

glyphosate, recognized as being carcinogenic to humans, and for its effect on our gut microbiome⁸.

Roundup-sprayed GMO soya has already caused massive ecological devastation⁹ as well as chronic worldwide health problems¹⁰¹¹.

Promoting GMO soya 'plant-based meat' as 'fake and healthy meat' is misleading the eater both in terms of the origins of the burger and, most importantly, on claims of its safety. The Impossible burger is marketed promoting the myth that protein comes essentially from animals and now from "meat" produced in a lab by using GMO soya, manipulating people into forgetting that we have been getting our protein down the ages from the diversity of plants.

As Zen Honeycutt of Moms Across America states: "The levels of glyphosate detected in the Impossible Burger by Health Research Institute Laboratories were 11 times higher than the Beyond Meat Burger. This new product is being marketed as a solution for "healthy" eating, when in fact 11 ppb of glyphosate herbicide consumption can be highly dangerous"¹².

(a) Estimated annual agricultural glyphosate use relative to total herbicide use in the United States; (b) location of National Water Quality Network (NWQN) sites by region and classification by watershed land use; and (c) estimated 2016 regional glyphosate use by crop (Baker, 2018).¹³

¹³ Image source: Medalie, Laura & Baker, Nancy & Shoda, Megan & Stone, Wesley & Meyer, Michael & Stets, Edward & Wilson, Michaelah. (2019). Influence of land use and region on

Roundup Ready crops, which have led to an increase of 1,500% in Roundup spraying in the USA, failed in their primary objective of weed control¹⁴. Weeds evolved resistance to Roundup and have become "superweeds" requiring more and more lethal herbicides. Beneficial plants like amaranth have turned into superweeds. Bill Gates and DARPA are even calling for the use of gene drives to exterminate amaranth¹⁵, a sacred and nutritious food in India, since the Palmer Amaranth became a superweed in the Roundup Ready maize fields of the USA.

The following statement by Pat Brown, ¹⁶, CEO & Founder of Impossible Foods is most revealing.

He states, "If there's one thing that we know, it's that when an ancient unimprovable technology counters a better technology that is continuously improvable, it's just a matter of time before the game is over." He added, "I think our investors see this as a \$3 trillion opportunity."

Here we have a perfect example of the mechanistic and profit-based mindset which governs the extractive global system of producing food. For Brown and the fake food-promoting billionaires, real living food that nourishes our health is an "unimprovable technology".

The production of fake food is clearly about patents, profits and control with no regard or concept of the essence of life, the web of life and the vital role of living food in our health and that of the environment.

Patents are instruments of extracting royalties and rents by creating an artificial system to displace natural systems that are affordable, biodiverse, renewable and healthy, such as in the case of Monsanto trying to patent seeds to profit from farmers¹⁷ ¹⁸. The Impossible Burger today has no less than 15 patents for the processes of making artificial food¹⁹.

The sudden awakening to "plant-based diets" based on hyper-industrialized processing, including use of GMO soya, is an ontological violation of food as a living system which connects us to the ecosystem and other beings. It also indicates

glyphosate and aminomethylphosphonic acid in streams in the USA. *Science of The Total Environment*. 707. 136008. 10.1016/j.scitotenv.2019.136008.

ignorance of the diversity of cultures that have always used a diversity of plants in their diets.

Artificial lab food reduces real food to industrial raw material and promotes large scale monocultures of industrial farming for supply of raw material.

As Bob Reiter, Bayer's head of research and development in reference to plant-based meat companies: "They are sourcing different types of crops, and that also could create opportunity for us, being a company that is a plant-breeding company"²⁰.

Oblivious of the clearly growing shift to agroecology and organic food with more and more communities creating local, diversity-based, ecological, systems of growing food, the Poison Cartel continues to manipulate and promote new industrially- based markets.

Biodiversity Festival at Navdanya, 2018

Through fake food, health, indigenous food cultures, evolution, biodiversity, and the web of life are being disparaged as "ancient unimprovable technologies"²¹, totally ignorant of the sophisticated knowledges that have evolved in diverse agricultural and food cultures, in diverse climate and ecosystems to sustain and renew the biodiversity, the ecosystems, and the health of people and of the planet which have so far allowed humanity to survive.

Our knowledge of Food for Health is being erased.

At a time when movements across the world are growing and getting stronger for a GMO and chemical-poison-free future²², and independent scientists are establishing the links between cancer and vital organ failure and chemicals such as glyphosate (Roundup) which go hand in hand with GMOs²³, these destructive tools are being given a new lease on life through artificial lab food as Big Tech, Big Food and Big Pharma become one in the Gates Empire.

Artificial, ultra-processed food will further spread chronic diseases. The “market” in sickness and disease will continue to grow. With an expanding market of ill-health, so too profits for the 1% will keep growing.

The reality by now should be clear: Industrial food is the basis of disease, whereas Organic biodiversity-based food is the basis of health²⁴.

A recent study has shown that a week of eating organic food reduces glyphosate levels by 70%²⁵.

“Roti, Gujarat

Fake food is building on a century and a half of food imperialism and food colonization of our diverse food knowledges and cultures. Decolonisation of food is at the heart of protecting the health of the planet and people.

Food is the basis of life and freedom. In times of Digital Dictatorship freedom begins with food. Food Freedom is an inviolable right.

THE WORLD'S TECH FOUNDERS ARE MASSIVELY INVESTING IN SYNTHETIC BIOLOGY

The industry of Synthetic Biology is booming. It has reached a worth of 12 billion dollars over the past decade (of which 3.8 billion dollars make up only last year)- and is expected to double by 2025. In the last twenty years the number of companies specialising in this field have increased from less than 100 in 2000, to over 600 this year.

Synthetic Biology involves reconfiguring the DNA of an organism to create something entirely new, allowing for limitless applications in multiple fields, such as “fake meat” and other “fake foods”, to agriculture, to new engineered raw materials, and pharmaceuticals.

Among the largest investors in this sector is Microsoft founder Bill Gates. His early investments include Beyond Meat, Ginkgo Bioworks– which is developing custom-built microbes– as well as Pivot Bio, a biotech startup that focuses on making nitrogen fixing microbes.

Eric Schmidt, co-founder of Google has invested in several synthetic biology companies through early-stage venture capital firm Innovation Endeavours. His synthetic biology portfolio includes Zymergen, Bolt Threads, GRO Biosciences, and Ukko.

Peter Thiel, co-founder of PayPal, Palantir Technologies, and Founders Fund, a world-renowned VC firm and, also, the first investor in Facebook, has invested along with Schmidt in Bolt Threads, and is also backing Synthego and Emerald Cloud Lab.

Marc Andreessen, founder of Netscape and Andreessen Horowitz invested in Benchling—a company that offers tools to engineer DNA digitally.

Other high-profile investors in synthetic biology include Vinod Khosla (Sun Microsystems), Jerry Yang (Yahoo!), Bryan Johnson (Venmo), and Max Levchin (PayPal)¹.

Impossible Foods Patents — Partial Listing

Impossible Foods should really be called Impossible Patents. It's not food; it's software, intellectual property — 14 patents, in fact, in each bite of Impossible Burger with over 100 additional patents pending for animal proxies from chicken to fish. It's iFood, the next killer app. Just download your flavor. This is likely the appeal for Bill Gates, their über investor. It's a food operating system (FOS), a predecessor, perhaps, to a merger with Microsoft. MS-FOOD. The business model is already etched in Silicon Valley — license core technology (protein synthesis) while seeking vertical integration of supply chains, which, in this case, is not from coders to users, but from genetic engineers to protein seekers.

*Will Impossible Foods stand against healthy soils legislation?
That will reveal what their appetite is for.*

In this software-as-food scenario, there is no place for nature. Manufacturing of Impossible Burger starts with glyphosate-sprayed soy grown on what was once healthy prairie. It is then infused with heme molecules produced

by patented yeast in high-tech labs for the blood-like upgrade. Finally, it ends its journey as a plastic-wrapped puck that some are brave enough to ingest. Just fry with canola oil and the illusion of a meal is complete. As Pat Brown, Impossible Foods founder and CEO openly states, animals are just a “technology” that consumers simply had to “live with.”

“animals have just been the technology we have used up until now to produce meat... What consumers value about meat has nothing to do with how it's made. They just live with the fact that it's made from animals.”
— Pat Brown, Impossible Foods CEO

The pretense that this wealth-concentrating march of the software industry into the food sector is in any way good for people or the environment is predicated on a comparison with only the worst aspects of animal agriculture. It ignores, entirely, the rapidly growing regenerative movement that is offering so much hope for the planet at this key time, healing landscapes, replenishing aquifers, and mitigating fires. Thus, because of its reliance on grains, tillage, pesticides and fertilizers, fake meat of scale exacerbates depletion of grasslands while undermining a more legitimate solution. As soon as there is a price on soil carbon, however, this misdirection becomes evident. Will Impossible Foods stand against healthy soils legislation? That will reveal what their appetite is for.

SECTION 5

**ONE EMPIRE OVER MEDIA,
HEALTH AND EDUCATION**

THE POWER OF PROPAGANDA AND THE LANGUAGE OF PERSUASION ¹

Nicoletta Dentico

Beyond the recent conspiracy theories, on a planetary scale, the icon of philanthropist Bill Gates corresponds to the image of generosity. The optimistic and positive language with which he encloses problems and hurries to administer solutions is an advanced form of magic used to enchant his global audience, and even himself.

Clearly, Bill and Melinda believe that aid storytelling needs to be improved with more success stories and telling progress in some areas of development. It's not for nothing that their philanthropy blog is called 'Impatient Optimists'².

This skilful, symbolic construct is one of the areas of investment that the Bill & Melinda Gates Foundation manages most carefully, funding international newspapers such as NBC Universal, Al Jazeera, BBC, Viacom, to name but the most famous. Less known to the public, is the function of the Gates couple as a behind-the-scenes influencer of international magazines and media, something certainly not secondary³.

Clearly, the public cannot fully grasp the collaborations that the Gates Foundation has consolidated with the media and the press through its advocacy and policy programs⁴, and above all, they do not see any trace of them although they are influential and substantial.

The Foundation does not spare resources devoted to the world of information: almost a billion dollars are allocated to forage this powerful consensus machine, which moves in unison with field programmes (health, agriculture, education) and educational and scientific research initiatives. The two scholars Alanna Shaik and Laura Freschi gave an effective representation of this when they wrote that we are in a situation where we might find ourselves "reading a story about a Gates-funded health project, written up in a newspaper that gets its health coverage underwritten by Gates, reported by a journalist who attended a Gates-funded journalism training program, citing data collected and analysed by

⁴ "What We Do." Last modified January 1, 2001. <https://www.gatesfoundation.org/what-we-do>

scientists with grants from Gates."⁵

In particular, the Foundation is interested in promoting partnerships with journalists and newspapers on global health and development agenda issues. The Guardian in English, El Pais in Spanish, National Public Radio and Public Broadcasting Service in America, the African Media Initiative: these are just some of the newspapers and media that have most focused their editorial choices on international issues on the priorities on which the Foundation operates, and which act as a sounding board for Seattle's activities.

An interesting case is the disbursement of \$1 million to Harvard University for the Nieman Fellowship, on the Global Health Reportage, and the HIV Prevention Reporting Fellowship Fund in Sub-Saharan Africa⁶. The type of funding allocated to the press is associated with an impact award.

The flagship initiative, "Innovation in Development Reporting" (IDR), defines the grid for reading reality and the transformative horizon towards which to set the project to be funded. Including the need for specific and measurable objectives to be achieved through media action (article, radio report, video, social media, etc..), according to the perspective of the so-called solution journalism⁷, also funded by the Gates Foundation, which aims to catalyse the media focus towards activities that solve problems, with the intention of depolarizing public dialogue and relaunching the Western version of human progress.

So far IDR has funded 185 projects⁸. The result has been a marked increase in the focus on global poverty and public health issues. The narrative threads of this journalistic production generally follow the priorities and the cognitive approach of the Gates Foundation, which generally leads to positive publicity. While journalism, especially in the wake of the wave against racism that rightly pervades the world, would need more diversity and less white supremacy, the Gates Foundation's strategy is, on the contrary, focused on investing in the training of new generations of journalists, particularly in Africa.

The pervasiveness of Gates in journalistic production, increasingly in crisis, is a phenomenon which, because of its problematic nature and conflict of interest, has repeatedly attracted the attention of the Fairness and Accuracy in Reporting (FAIR) observatory⁹.

MESSENERS OF GATES' AGENDA: HOW THE CORNELL ALLIANCE SPREADS DISINFORMATION AND DISCREDITS AGROECOLOGY ¹

Community Alliance for Global Justice / AGRA Watch

The Bill and Melinda Gates Foundation (BMGF) has emerged over the past decade as an extremely influential actor in an ever-intensifying battle over the future of food and agriculture, pumping major funding into industrial agriculture while participating in powerful alliances seeking to reshape the trajectory of global governance of the food system. While some of these activities are drawing increasing scrutiny and analysis, this study examines a lesser-known aspect of BMGF's strategy: framing the debates and shaping how issues are communicated, as well as fostering a new generation of leadership to carry forward its mission. Funded by BMGF, the Cornell Alliance for Science (CAS) uses its affiliation with the only ivy league institution that is a land-grant college to claim scientific neutrality while assiduously promoting communications aligned with agribusiness in its use of fellows, especially those from Africa.

"Entrance to Bill & Melinda Gates Hall, Cornell University, Ithaca, NY", by Kenneth C. Zirkel, is licensed under CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/deed.en>).

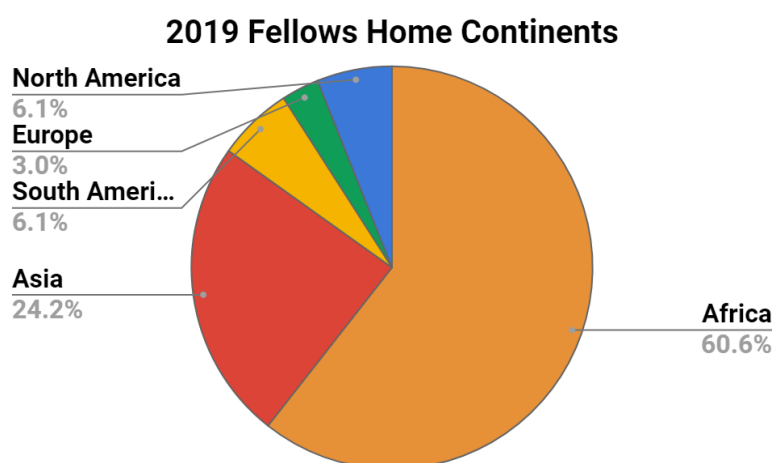

¹ Extracted from: "Messengers of Gates' Agenda: A Case Study of the Cornell Alliance for Science Global Leadership Fellows Program". *Community Alliance for Global Justice / AGRA Watch*, 2020. <https://cagj.org/2020/08/new-agra-watch-report-messengers-of-gates-agenda-a-case-study-of-the-cornell-alliance-for-science-global-leadership-fellows-program/>

Housed in Cornell University's College of Agriculture and Life Sciences in Ithaca, New York, the Cornell Alliance for Science (CAS) was launched in 2014 through a \$5.6 million endowment by the Gates Foundation "to promote access to scientific innovation as a means of enhancing food security, improving environmental sustainability and raising the quality of life globally."² According to CAS director Sarah Evanega, CAS aims to "depolarize the GMO debate and engage with potential partners who may share common values around poverty reduction and sustainable agriculture, but may not be well informed about the potential biotechnology has for solving major agricultural challenges."³ A second grant of \$6.4 million in 2017 brought the total contribution of BMGF to CAS to \$12 million. BMGF remains the primary funder of CAS to date, while fifteen additional institutional and individual contributors of \$1000 or more are listed on the CAS website.

CAS describes its main strategies as: a) establishing a global network; b) "training with a purpose"; c) developing multimedia communications on agricultural biotechnology.

These strategies come together through its Global Leadership Fellows Program, a 12-week intensive training course held each year at Cornell bringing together 20–30 young professionals, mainly from the Global South, and particularly Africa. While the geographical reach of the program has been broadening, the majority of fellows – 60.6% in 2019 – were of African origin, in keeping with prior years (See Figure 1). Upon examination of the fellows' affiliations, multiple linkages with BMGF become apparent. Cross checking the fellows' affiliations with grant disbursement data provided on the BMGF website, we can see that 34% of all the African fellows from 2015–2019 were associated with organizations that received funding from BMGF. Together, organizations connected to the fellows received over \$712 million from BMGF from 2003 through 2019.

Figure 1: Home continents of 2019 CAS Fellows

² Cornell Alliance for Science. Our Mission. <https://allianceforscience.cornell.edu/about/mission/>

³ Shackford, S. 2014. New Cornell Alliance for Science gets \$5.6 million grant. <https://news.cornell.edu/stories/2014/08/new-cornell-alliance-science-gets-56-million-grant>.

The strong overlap between the groups funded by BMGF for agricultural development and the CAS fellows gives additional meaning to the CAS strategy of building a global network, begging the question, *whom does this network serve, and toward what ends?* Given these linkages, it comes as little surprise that there are strong parallels between the types of technologies promoted by BMGF through its agricultural investments and the messages coming from CAS and its fellows – many of whom come from BMGF-backed organizations. In analyzing the work put out by CAS and its fellows, a striking pattern emerges of there being a singular focus and message running throughout almost all of it: an uncritical promotion of biotechnology. Furthermore, in a distortion of scientific methodology, this position is not vetted against any diverging ones. What adds power to the narratives of CAS it is that its messages are not coming from BMGF or from its agribusiness partners directly, but from mostly young, African voices that make up its Fellowship Program, ostensibly informed by their lived experiences and claimed scientific rigor, given the affiliation with Cornell.

Through its funding for the Cornell Alliance for Science, the Bill and Melinda Gates Foundation is seeking to shape public opinion in favor of adopting GMOs and corporate agriculture. CAS is building a new generation of leaders to carry out BMGF's mission of spreading corporate biotechnology across the Global South, particularly Africa. A key communications strategy of CAS is to promote narratives in which biotechnology is equated with 'science' and critique of biotechnology is equated with being 'anti-science.' That the attacks on agroecology by CAS are coming at the same time that there is a mounting global scientific consensus around the merits of agroecology is no coincidence. Studies have demonstrated that perceived scientific consensus is a key factor in influencing public support on a given issue and that this tends to encourage counter-efforts around "the 'manufacture of doubt' by political and vested interests."⁴ As momentum continues to build around agroecology, its advocates can be certain that further smear campaigns and other attempts to manufacture doubt will continue. Ultimately, analyzing the Gates Foundation's networks of influence points to the need for the food sovereignty movement to develop robust communication strategies of our own.

DIGITAL DICTATORS

Satish Kumar

Technology is seductive and a double-edged sword. It can be a useful tool to connect or it can be a brutal weapon to control. If technology is the servant and if it is used with wisdom to enhance human relationships, without polluting the environment and without wasting natural resources then technology can be good. But if technology becomes the master, and human creativity and ecological integrity are sacrificed at the altar of technology then technology becomes a curse.

In the recent past New York governor, Andrew Cuomo, Bill Gates of Microsoft and former Google CEO, Eric Schmidt, have been promoting the idea of transforming face to face learning to a system of education rooted in internet technology and operated by remote control. Thereby, integrating digital technology, fully and permanently, into educational process. And by doing so getting away from the need for personal relationships and intimate interactions between students and teachers. Cuomo, Gates and Schmidt come from a school of thought which subscribes to the theory that 'technology is the solution, what is your problem?'

Unfortunately, these highly 'educated' people do not seem to know the meaning of 'education'. The word is derived from Latin 'educare'. It means to bring forth or lead out or draw out what is potentially already there.

Every human person comes into this world with his or her own unique potential. The work of a true teacher is to observe and spot that special quality in a child and help to nurture it and enhance it with care, attention, and empathy. Thus, the beautiful idea of education is to maintain human diversity, cultural diversity, and diversity of talents through decentralised, democratic, human scale and personalised systems of schooling.

A good school is a community of learners where education is not pre-determined by remote authorities, rather it is a journey of exploration where students, teachers and parents are working together to discover right ways to relate to the world and to find meaningful means of living in the world.

The idea of digital learning through remote control and pre-determined curriculums moves away from the rich and holistic philosophy of education. Digital teaching looks at children as if they were empty vessels in need of being filled with external information. The quality of information or knowledge given to the child remotely and digitally is determined centrally by people who have a vested interest in a particular outcome. And that outcome is largely to turn humans into instruments to run the money machine and to increase the profitability of big corporations.

Satish Kumar, Gandhi and Globalisation course, Navdanya Earth University

Such centralised and impersonalised systems of digital education will destroy diversity and impose uniformity, destroy community culture, and impose corporate culture, destroy multiple cultures, and impose monoculture.

When teachers teach remotely, they tend to think as if the children have no body, no hands, and no heart. They have only a head. The information taught digitally is almost entirely of intellectual nature. Thus, digitally educated children are less than half educated. Eating half baked bread gives you indigestion; life of a half-educated person lacks coherence and integrity. A proper education should include the education of the head, education of the heart and education of the hands. In an ideal school community, children learn maths with music, science with spirituality and history with a human touch. Academic knowledge is complemented by the learning of the arts and crafts.

A computer cannot teach kindness. Only in a real learning community can children learn how to be kind, how to be compassionate and how to be respectful. In a school community, children learn together, play together, eat together, and laugh together. They produce plays and perform concerts together. They go on field trips together. It is through these shared human activities that children gain a deep appreciation of life. Education is more than the acquisition of information and facts; education is a living experience. Sitting in front of a computer for hours is no way to learn social skills.

Placing the future of our children in the hands of a few digital giants like Google, Microsoft and Amazon and putting them in charge of educational systems is a recipe for digital dictatorship and opens the doors to disaster. If democratic societies are opposed to military dictatorship, then why should they embrace corporate dictatorship? Through smart technologies these giant corporations will be able to trace and exploit every activity of children and later, when they are adults, through data

manipulation and control. Who wants to embrace such 'dystopia'?

Rather than investing in top down, artificial, sedative, and virtual technology, democratic societies should be investing in people. We should be investing in more teachers in smaller schools, with smaller class sizes and bottom up, imaginative, benign, and appropriate technology.

We have already experienced the way algorithms, artificial intelligence, biotechnology, nanotechnology, and other forms of so-called smart technologies have been used to control, manipulate and undermine democratic values. The techno giants who consider humans as 'biohazards' cannot be trusted with the future of our children. We should be embracing the Green New Deal and not what Naomi Klein rightly condemns as the Screen New Deal.

We need the greening of education rather than the screening of education. Our children need to learn not only about nature but from nature. They need to learn from forests and farming, from permaculture and agriculture, from agro-ecology and organic gardening, from marine life and wildlife. Such knowledge and skills cannot be learned by looking at computer screens.

A computer is a box. It teaches you to think within the box. If you want to think outside of the box, you need to go out into your community, and out into the natural world.

Children need to go out in nature with experienced teachers. Nature herself is the best and the greatest teacher. With the combination of human teacher and nature teacher assisted by a limited amount of internet, children will gain a much more rounded education than through a digitally controlled and centralised system proposed by the techno giants.

Technology has a place in education but let us keep it in its place and not allow technology to dominate our lives and the lives of our children. Technology is a good servant but a bad master.

Satish Kumar, Gandhi and Globalisation course, Navdanya Earth University

PEDAGOGY OF FREEDOM

Satish Kumar

The word 'Education' is derived from Latin 'educare' which means 'to bring up' or 'to bring forth' or 'to draw out'. Thus, education doesn't mean teaching, or schooling or giving of knowledge or even acquisition of knowledge. Education simply means development of the qualities which are already there. Socrates compared a teacher with a midwife who just helps to bring forth the child.

I compare a teacher with a gardener or an orchard keeper. The tree is already in the seed. The seed knows what kind of tree it is. The gardener doesn't put a tree in the seed, only helps the seed to become a tree. The gardener may find a piece of good soil to plant the seed, put good organic compost to nourish the seed, put a fence to protect the seed, give water to nurture the seed, but a gardener never tries to change an apple seed into a pear tree.

Parents and teachers need to be like gardeners. They need to observe their children, understand them, help them to become who they are, support them on their way to self-realisation. But never try to impose on them their idea of an "educated person".

In our modern Industrial Age education has become confused with training, schooling or acquisition of facts, information and knowledge in order to get a job. Rather than a teacher helping a pupil to become who he or she truly is and realise his or her true potential, a teacher has become a technician or a trainer or even an agent to meet the needs of the market. The teacher is paid to mould the child so that he or she is fit to make a success of the economy. In this kind of educational system, the market and the economy become the masters and the human beings become servants.

This corruption of education worried J. Krishnamurti. When I first met him on the banks of River Ganga in Varanasi, in 1960, he said to me, "I want to recover the original and actual meaning of the noble word 'Education'. I want schools and teachers to return to the true meaning of the word and dedicate themselves to the cause of helping young people to discover their vocation."

Krishnamurti further said to me, "there is nothing wrong with the market or with the economy. As long as they serve the needs of humans, they have a place in the world. But when humans are required to serve the needs of the market and the economy then we are in real trouble. Unfortunately, that is the problem at this moment in the world. This is why we need a total revolution in our idea of education."

"I understand the etymological meaning of the word, education," I said "But do you have something more to say about it?" "I asked.

"Yes, I do. I want to say that we need to liberate ourselves from the idea that education takes place only within the four walls of a school. It is not that you read a book, go to a classroom for your lessons or pass an examination and then you have finished with your education. Education is a life-long process. From the moment you are born to the moment you die you are in the journey of learning," said Krishnamurti.

"What exactly are we trying to learn during this journey of life?" "I asked.

"We are learning to be Free! Learning is all about liberation. We need to learn to be free from fear, free from anxiety, free from dogmas and doctrines. We need to discover and rediscover that we are born free and freedom is our birth right! Fear is a conditioning of the mind. From our family, from our religious belief, from our media and even from our educational systems we are conditioned to fear. The purpose of true education is to free us from all kinds of fears."

For me this was a new Pedagogy of Freedom!

But our educational system at present is totally unaware of the fact that it is based on the Pedagogy of Fear!

Since that meeting with Krishnamurti, I have keenly observed and realised that schools and universities around the world seem to look at their students and think of them as if they have no bodies! They have no hands, no hearts, no senses, only brains. All education is focused on the education of heads only. No wonder that many of our young people feel inadequate, incompetent and fearful. They have never developed their heart qualities. They don't know how to relate to other people and to the natural world. This lack of emotional and spiritual intelligence is a major cause of fear. The usual educational curriculum includes almost nothing about compassion, about a sense of service, about courage or about love! These qualities should be cultivated during the time we are being educated.

Most educated people not only lack this spiritual and emotional intelligence, they also lack body-intelligence. The curriculum also ignores all practical or physical skills. Most undergraduates or postgraduates coming out of Universities know nothing about growing food, nothing about building a house, nothing about mending or repairing and almost nothing about cooking. They have highly trained heads superbly capable of complaining, comparing, criticising and strong desire to control and consume. They have little or no capacity for making, producing, building or creating. There is very little in our educational philosophy or practice which promotes self-reliance and self-confidence.

On top of this deficit in emotional intelligence and body-intelligence the current educational system is more or less indifferent to the development of the imagination. Music, art, dance, plays, poetry and philosophy are relegated to some distant and specialist corners. Instead of the Arts being an integral part of everyday life they have been exiled to museums and art galleries to be pursued by a small minority of celebrities and marketed as commercialised commodities, or practiced by a small number of struggling idealists, who can hardly make a living.

The educational system produces millions upon millions of young people to serve the needs of machines, markets and money. And all these young people are struggling to compete and succeed and are often afraid of not succeeding.

This fear of failure is one of the most detrimental aspects of the current Pedagogy.

In order to compensate for this fear of failure, young people are encouraged to seek success for themselves; seek bigger salaries, bigger cars, bigger houses and higher positions with higher expectations. Some succeed, but many fail. This ego-centric rat race results in family breakdown, mental breakdown, discontentment, depression and disappointment.

J. Krishnamurti was pained to see such a state of degradation in education. He called education a noble word which is misunderstood and misused. Therefore, instead of just criticising the present paradigm, he established a number of exemplary schools where learning, living and loving are integrated. In these schools we can witness the education of head, heart and hands. I have had the privilege of visiting them and found that teenage girls and boys there are enjoying a holistic approach to learning, based on a Pedagogy of Freedom. I wish these schools would provide a University level of education so that the students don't have to enter into the Pedagogy of Fear after they leave Krishnamurti Schools.

THE PHILANTHROPIC MONOPOLY OF BILL & MELINDA GATES¹

Nicoletta Dentico

The Gates Foundation provides more global health funding than any major donor country. Influential newspapers praise Bill and Melinda for the fact that the two have revolutionized public health and the lives of billions of people on the planet². In short, when we talk about Bill Gates as a philanthropist, we are dealing with a story of monopolistic vocation comparable only to the story of Bill Gates as Microsoft's entrepreneur. The style and culture of the company are identical, it is no coincidence that the two have always been intimately linked. Jeff Raikes, Microsoft's key man after Bill Gates, was the head of the foundation and so was Microsoft co-founder Paul Allen, CEO of the foundation until 2013³. After all, in the logic of philanthro-capitalism, doing business and doing benevolence are two sides of the same coin. It is reasonable to think that the Foundation, in so far as it promotes a development of the global South inspired by information technology and supported by the intervention of large companies, helps Microsoft. The Foundation helps Microsoft when it puts pressure on national governments to open its doors to the big companies with which it has a privileged relationship - Cargill, Monsanto, Nestlè, Mars, DuPont Pioneer, Syngenta, Bayer, just to mention the ones that recur most frequently in its programs⁵.

There is no development area in which the foundation does not act as a superpower.

This subjugation no longer applies only to the constellation of organisations that depend on it for funding, but to a growing number of governments, not only among middle- and low-income countries. For 25 years, the Gates Foundation has held a position of undisputed hegemony with 1541 employees (as of 2017) comprised between its headquarters in Seattle, and seven offices around the world (Washington, London, New Delhi, Beijing, Addis Ababa, Johannesburg and Abuja), and an endowment of 50.7 billion dollars (as of 31 December 2017)⁶. The assets include a donation by Bill Gates, of about 35.8 billion dollars in Microsoft

shares (as of December 2019), and the mega-donation of 30.7 billion dollars that was announced at the end of June 2006⁷ by Warren Buffet, owner of the holding company Berkshire Hathaway. 83% of the patrimony of the second richest man in the world (Buffet) was destined to the charitable activities of the first billionaire on the planet (Gates)⁸. An ingenious move that would incorporate the Berkshire Hathaway holding company he owned into the foundation's investment apparatus. It was clearly a historic step for Seattle, with Buffet's entry into the foundation and Bill Gates' subsequent decision to leave Microsoft to devote himself full-time to philanthropy⁹.

Since then, the foundation has been structured into two separate entities: the actual Bill & Melinda Gates Foundation, which selects strategic priorities, projects to be funded and allocates funds; and the Bill & Melinda Gates Foundation Trust, which is managed by Buffet and is responsible for managing the Foundation's assets, taking care of investments so as to finance the Foundation's ability to donate. And here's the best part¹⁰.

⁹ "History." Last modified January 1, 2001. <https://www.gatesfoundation.org/Who-We-Are/General-Information/History>

¹⁰ Lee, Jaeah, and Alex Park. "You Won't Believe the Companies Bill Gates' Foundation Invests In." *Mother Jones*, n.d. <https://www.motherjones.com/environment/2013/12/gates-foundations-24-most-egregious-investments/>.

From the records¹¹, it emerges that the Gates Foundation Trust's direct investments include the following:

- \$ 466 million in Coca-Cola factories operating south of the US;
- \$ 837 million in Walmart, the largest food, pharmaceutical and alcohol chain in the US;
- \$ 280 million in the Walgreen-Boots Alliance, a large multinational retail drug company;
- \$ 650 million in two television production giants, GroupTelevisa (\$ 433 ml) and Liberty Global PLC (\$ 221 ml).

Furthermore, through Warren Buffet, a quarter of the Foundation's assets are invested in his own holding company Berkshire Hathaway Inc., which holds \$17 billion of shares in the Coca-Cola Company in the United States, and \$29 billion in funds invested in Kraft Heinz Inc., one of the top ten companies in the food industry. As pointed out in a letter from civil society to the WHO¹², and concerned about the company's dangerous liaisons with the Seattle philanthropist, the Bill & Melinda Gates Foundation is a beneficiary of the sale of products that are subjected to WHO standards and regulations, as well as government policies on nutrition, drugs and health. Bill Gates, Melinda Gates and Warren Buffet form an impregnable trinity that has governed the Foundation since 2006. Those who own wealth are the real dominant subjects, and they wield the hegemony of a class that has freed itself of any counterweight.

FINANCIALIZATION OF DEVELOPMENT: PHILANTHROPIC FINANCE AND CREATION OF NEW MARKETS FOR THE POOR

We do not have the opportunity to verify the fates of the "human promises" sown in the different communities across the planet, as foundations are not particularly fond of independent external evaluations. However, we do have evidence of a promise that the foundation "catalyses" with increasing vigour.

A twofold promise. First, that of expanding the horizons of investors, drawing them into unknown territories of global health such as forgotten diseases or the health markets of the poorest, with promises of substantial returns on investment and risk reductions - also from these markets a profit can be drawn.

And second, that of making direct investments in multinational corporations, with the aim of involving them in responding to the needs of the poor while enhancing the companies' need for market expansion.

With an agenda that we could define as evolutionary, the Gates perfectly capture the passage of the new phase of capital building, which differs from previous rounds of privatisation and reforms because it aims straight at the financialisation of social dynamics and public services.

It is the international institutions themselves - with the World Bank in the lead - that are paving the way for attractive investment routes and inaugurating the operational trajectories of this acceleration, with the aim of providing private individuals with technical assistance for co-investment initiatives, loans, and guarantees¹³, as well as the testing of new classes of strictly investor-friendly financial instruments, i.e. aimed at reducing the risk of investment, with the use of public funds capable of attracting private financial capital.

This has led to the germination of thematic bonds and new investment categories that include, for example, health bonds (GAVI's International Financial Facility for Immunization¹⁴), pandemic bonds (such as Ebola Bond¹⁵) or the more recent forms of impact bonds (such as Cameroon Cataract Performance Bond¹⁶).

investment arm, plays a central role in this scenario and a recognized leading role, especially in Africa, India and China, to channel private finance into health insurance, medical training and digital technology¹⁷. According to the IFC specialists themselves, health is one of the most promising areas in terms of investment return¹⁸; as the representative of a South African fund quoted by Bloomberg explains, "the economic management of HIV/Aids can be very profitable because the treatment involves not only medicines but also nutritional support, and opportunities are guaranteed throughout the entire value chain, from wholesalers to distribution"¹⁹.

The Gates Foundation is one of the most accredited partners of IFC: it has considerable influence both in the direction and in the selection of projects. Gates is in the Business of Health in Africa group, has invested substantial capital in Africa Health System Management's Investment Fund for Health in Africa, and has undisputed leadership in the controversial Global Health Investment Fund²⁰.

This provides the foundation with an unrivalled capacity of acting as a broker of public-private alliances which can transform the sector's financial markets through intermediary investment funds often registered in tax havens such as Mauritius and the Cayman Islands²¹. The foundation also manages to intervene at the regulatory level in the countries involved, so that companies can operate under legal, as well as fiscal, *laissez faire* systems while having little or no transparency²².

The aim is to mobilize the involvement of large companies to design new products or engineer new market models, aimed at poor countries. Gates is convinced that market mechanisms can be put in a position to work well for populations that have no purchasing power. And that, in order to face the problems of the world, it is necessary to intercept the creativity, efficiency and innovative potential of the private sector²³.

Taking over Global Health

At the time of Bill's first trip to India, in 1997, and his direct experience with an anti-polio vaccination program, the interest in the field of health grew, and the creation of the Bill & Melinda Gates Children's Vaccine Programme in 1998, to accelerate access to vaccines for children in low-income countries, took shape. The first donation amounted to \$100 million²⁴. From there came the activism in the field of global health, as well as the approaches that will characterize the work of the foundation. This was also the starting point for the financial pressure aimed at directing international political consensus towards technical solutions.²⁵

The Global Alliance for Vaccine Immunizations (GAVI), was announced with great fanfare at the World Economic Forum in 2000. With an investment of \$750 million over five years, the Seattle-based couple gave birth to a health start-up that would quickly catalyze governments, other major donors, and multilateral institutions. GAVI is the first major creature of Gates philanthropy, of which they are still the largest private investors to date with \$4.1 billion²⁶. The birth of GAVI marks the first deviation in global health governance, and heralds the launch of a model of institutional hybridisation that will be unquestionably successful because of the political impetus and resources it will receive from the Gates. The collaboration with other foundations, and with new initiatives that came into being, formed a thick and practically impenetrable embroidery. To the point of unravelling, one piece at a time, the old fabric of classical multilateralism, which arose on the ashes of two world wars, and on the human rights value framework.

The Global Alliance for Vaccine Immunization: the debut of the public-private model in health

The Global Alliance for Vaccine Immunizations (GAVI) is an independent public-private partnership that aims to "save the lives of children and protect people's health by increasing vaccination coverage programs in poor countries"²⁷. Established in 1999, GAVI was launched in Davos in January 2000 with the adherence of multilateral entities such as WHO, UNICEF and the World Bank. Its headquarters is located in Geneva. Since 2000, 16 billion dollars have been invested in 76 low and middle-income countries to strengthen vaccination campaigns, with the aim of increasing the sustainability of national programmes and, above all, conforming national markets to the relaunch of vaccines and other immunization products. GAVI has received a total of \$18 billion from funders (June 2019). 79% of the funds came from a core group of northern donor governments - the United States, the United Kingdom, Norway, Germany, Canada, Sweden, Italy and the Netherlands - recently followed by Greece.

²⁶ "The Bill & Melinda Gates Foundation." <https://www.gavi.org/investing-gavi/funding/donor-profiles/bill-melinda-gates-foundation>

²⁷ "Strategy." <https://www.gavi.org/our-alliance/strategy>

The largest private donor remains the Gates Foundation, which alone covers 20.8% of the budget. For the five-year period from 2021 to 2025, GAVI had planned to raise \$7.4 billion²⁸. But on the basis of Covid19, the refinancing conference held in London at the beginning of June 2020, mobilized a much higher amount, \$8.8 billion, with which GAVI - it was declared - will be able to immunize 300 million children against 17 infectious diseases in over 50 more fragile and developing countries²⁹.

Despite the result of an objective and significant increase in the number of children with vaccine coverage - between 2000 and today, according to institutional communication, GAVI and its partners have immunized more than 760 million children, and saved 13 million lives - GAVI has been criticized by accredited scholars and civil society researchers as the most accomplished expression of the so-called "Gates approach" to health challenges. What exactly does that mean? We are referring to the choice to fund vertical programs for specific diseases, with individual interventions (vaccines) that are not supported by actions to strengthen health systems. In 2005, in response to these criticisms, GAVI inserted an operational window dedicated to health systems, a move that did not fully convince the analysts considering the scarcity of funds (only 10.6%) addressed to this purpose³⁰. In addition, by "health system" GAVI mostly means the creation of "health markets" to stimulate the purchase and inclusion of new vaccines, with a preference for adjustments imposed from above and easily measurable³¹.

Through GAVI, the Bill & Melinda Gates Foundation strongly promotes the financialisation of health. In its 20 years of operation, GAVI has been the conceptual cradle of new financial incentives for the pharmaceutical industry to research and develop new vaccines for people living in low and low-middle-income countries. GAVI's programs exclude middle-income countries, which is a major concern. Among the main financial mechanisms put in place are the vaccine bonds of the International Financial Facility for Immunization (IFFIM) and the Advanced Market Commitment mechanism. An incentive that has given rise to a number of bellyaches because of the massive subsidy of public development aid investments to pharmaceutical multinationals (Pfizer and GlaxoSmithKline) for the production of anti-pneumococcal vaccines, with a final price negotiated without any transparency. Which is definitely high for low-income and lower-middle-income countries³².

The philanthropic epidemic: how to donate to control global health

With the ability to invest great personal wealth and enjoy maximum media visibility in the global circuits that matter, the Gates foundation wisely handles the tools of consensus in the world of global health. Beyond the insistent narrative about Bill and Melinda and their common principles, and the obstinate personalisation of the battle for the health of the poor, one cannot overlook the juncture of opportunities which, like a propitious wind, swells the sails of the Seattle couple. The financial disengagement of Western governments towards the United Nations, in the aftermath of the Cold War³³, opened up boundless maneuvering space for Bill and his wife's optimistic activism in the field of international health. The finances of the WHO were increasingly uncertain - in the two-year period of 1990-91 when voluntary funds exceeded for the first time the regular payment due from the compulsory quotas of the Member Countries, which several countries suspended altogether (the United States, for example, refused to pay its accumulated debts)^{34,35}.

Following the merciless plans to cut social spending, which were imposed as a condition for lending to poor countries, the World Bank decreed a health reform strategy which aimed at promoting the private sector and generating markets³⁶. In the meantime, the international negotiations that resulted in the World Trade Organization (WTO) had definitively fenced off health as a variable of the economy. In the ascending phase of globalization, the countries of the South of the world had to cope with the onset of a number of infectious diseases without a chance: one among all, but not the only one, the HIV/Aids virus. Bill &

critique_MSFA-AC.pdf

³³ In the 1990s, the WHO suffered the reduction of compulsory contributions from Western governments, which directed their funding towards voluntary approaches, and for programmes chosen by the governments themselves, so as to reduce the operating margin of the WHO. The downturn in funding is counterbalanced by an important shift in the political scenario. The World Bank takes the lead over the WHO as a multilateral actor entitled to set strategies and provide funding for health in low- and middle-income countries. The World Bank's framework for action is consistent with the structural adjustment plans imposed as a condition for new development loans, and the provision of guarantees to make debt payments sustainable. In those same years the WHO was subjected to an unprecedented invective by the British Medical Journal, which recognized the United Nations agency's limited scope of intervention to health security and the control of infectious diseases on a scale. See in this regard: Godlee F., "WHO in retreat: is it losing its influence", in *BMJ*, December 1994, 309, pp. 1491-1495, <https://www.bmj.com/content/309/6967/1491.full>; Godlee F., "The World Health Organization: WHO at country level: a little impact, no strategy", in *BMJ*, December 1994, 309, pp. 1636-1639, <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2542000/>; Godlee F., "The World Health Organization: WHO in crisis", in *BMJ*, November 1994, 309, pp. 1424-1428, <https://www.bmj.com/content/309/6966/1424>

Melinda Gates fit into this gap³⁷ and filled the void left by governments' civil services. Their intervention, whether we like it or not, brought health back onto the international political agenda thanks to an injection of funds that first sprinkled the non-profit world, then think tanks and political analysis institutes, universities and public institutions (including, as we shall see, the World Health Organization)³⁸.

Bill Gates had no difficulty in establishing himself as the Pied Piper of global health³⁹. He created an increasingly complex and diversified constellation of public-private initiatives⁴⁰ to "harness advances in science and technology to save lives in developing countries"⁴¹, which allowed him to interface comprehensively with the scientific community, non-governmental organizations, and international institutions.^{42, 43} He then invented new management systems for the health alliances he created and new financing mechanisms for the initiatives in which he participates as a major or almost exclusive funder (color light purple in the diagram below).

⁴³ Ibid.em

The public-private alliances represent Bill Gates' Trojan horse, the influence area where the operating methods open the floodgates to the corporate sector (which Gates personifies) in the field of health and global development.⁴⁴.

With its new and central role, the Gates Foundation is overtaking even the Rockefeller Foundation with this change of scene, proceeding swiftly to the fideistic privatization of health with the blessing of the international financial organizations, as well as the protection of patents on pharmaceuticals for poverty-related diseases.

The Global Fund against HIV/Aids, Tuberculosis and Malaria, launched at the G8 in Genoa in 2001 and inaugurated as a private law entity in Switzerland in 2002, is the most disruptive of these new initiatives, was created to accelerate the efforts to combat the three pandemics that draw the attention of the international community. The Global Fund took its first steps by making use of the expertise, logistical and administrative structures of the WHO, which were essential to launch programmes in the countries of intervention⁴⁵, but its intended aim was to dynamise or bypass the fossilised procedures of the United Nations⁴⁶. Its creation served, among other things, to channel (if not divert) the transnational civil society movement which, since the Seattle summit in 1999⁴⁷, had vigorously contested the intellectual property regime produced by the WTO agreements, which represented an insurmountable obstacle to access to life-saving medicines in low and middle-income countries⁴⁸. Especially in Africa: the withdrawal of 39 pharmaceutical companies that had taken legal action against Nelson Mandela's South Africa⁴⁹, after the mobilisation of African patients, was a first resounding

⁴⁴ Birn AE, "Philanthrocapitalism Past and Present; op. cit. , p. 27.

⁴⁵ According to authoritative WHO representatives interviewed during the years of my work with Doctors Without Borders in Geneva, the creation of the Global Fund was a very hard and debilitating blow for the UN health agency. The attention of governments and funders was diverted to this new reality, often in competition with the WHO, albeit illegitimately, given that the Global Fund has a much more limited and agile governance structure and a much narrower operational mandate, limited to funding the fight against 3 diseases. Incredibly, UNAIDS and the WHO sit on the board of the Global Fund, but without voting rights. Private sector investors, including pharmaceutical companies and philanthropic foundations, instead have the right to vote.

⁴⁹ Towards the end of his term of office, Nelson Mandela had pushed the South African government to adopt a new law on pharmaceuticals that would introduce all the safeguards of the WTO Agreement on Intellectual Property and pave the way for greater access to essential therapies (Medicines Act, 1997), especially in the areas of HIV and tuberculosis. At that time, South Africa was the country with the highest prevalence of HIV-positive people in the world, and the highest level of multi-resistant tuberculosis to treatments available. The launch of the Medicines Act in 1997 led to the immediate opposition of 39 pharmaceutical companies, which filed a controversial lawsuit against the South African government that lasted until 2001. When the Chief Justice of the South African Supreme Court asked the pharmaceutical companies to show their budgets to demonstrate the damage the law would do to them, the companies unanimously decided to withdraw from the

victory against the abuse of big pharma, but it was also a wake-up call for the private sector and the Western countries that supported it. Non-governmental organisations had to be involved, and financed, as they promised a technical solution to the problem⁵⁰.

It cannot be said that this clever strategy did not work, and that it did not succeed in generating the adhesion to the Global Fund by large segments of international civil society. The new financial flow was aimed at organizing health programs that were increasingly separate from those of the WHO, around biomedical solutions in the fight against disease. Solutions that bring a substantial handful of industry representatives into the governance structures of new health initiatives, as well as the tendency to propose substantial subsidies to companies, incentives for the development and procurement of essential medicines and the stipulation of private contracts, which are by their very nature not easily accessible⁵¹.

As a result of pressuring vaccines as a solution to the problems of the poor, perhaps the most important question that arises is the chain of public responsibility in health, and in particular the autonomy of the WHO⁵².

Under pressure by Gates' activism and by competition from private-public health alliances that had never been seen before, the WHO - already weakened by the beginning of the new millennium - found itself operating in the field of health policies as an old tool of 20th century multilateralism. In a scenario dominated by fierce competition for visibility in the international community, the WHO soon had to deal with the prospect of gradual marginalization, preliminary to its occupation as a public body. Because, while traditional billionaires only need to buy an island to be happy, Bill Gates aimed to buy an entire UN agency. He is succeeding, but what is even more severe is that the international community is allowing him to do so. The disruptive effect of the Gates Foundation on the budget of the WHO is

case in 2001. It was estimated that if the Medicines Act had not been challenged in 1997, it would have saved the lives of 700,000 people in the four years of the trial. See in regard: Dentico N., "Globalizzazione e accesso alle cure: un'insolente storia di apartheid sanitario: Il ruolo delle industrie farmaceutiche, le responsabilità dei governi", in *Salute e Globalizzazione: primo rapporto dell'Osservatorio Italiano sulla Salute Globale*, La Feltrinelli, Milano, 2004, pp. 180-181.

⁵⁰ Legge D., "Protecting the right to health through action on the social determinants of health", presentation at an event on the eve of the World Conference on Social Determinants of Health, 18 October 2011, Rio de Janeiro, Brazil.

⁵¹ Doctors Without Borders has carefully monitored and taken a position several times on specific features of the public-private partnerships created by the Gates Foundation. In particular, it focused its attention on GAVI, highlighting the need for transparency in the negotiations between GAVI and the pharmaceutical companies in relation to the price of vaccines. It stressed the oddity of the presence on the Boards of Directors of health initiatives such as the Global Fund and GAVI of representatives of multinationals that derive industrial benefits from the operational choices of these entities, which they are able to influence directly. The GAVI Board of Directors, for example, provides for the presence of 9 independent representatives on the board, people "without professional connections to the work of GAVI", but the people chosen come exclusively from the financial sector, audit firms, banks. See Martens J. E Saetz K., op. cit. p. 30.

⁵² People's Health Movement, Medact, Third World Network et al., "Money talks at the World Health Organization", in *Global Health Watch 4: An Alternative World Health Report*, Zed Books Ltd., London, 2017, pp. 245-262.

mainly due to the unwillingness of the Member States to finance the institution, leaving it with freedom of manoeuvre on the use of money, which could be allocated to long-term programmes of the agency, whether on prevention or on important but neglected areas of intervention. Because of the reduction in government funds, further aggravated by the financial crisis of 2008, the WHO had to make cuts, laying off almost a third of its most qualified staff in 2009. While in subsequent years, halving the amount of funds allocated to health emergencies, just when the Ebola virus was spreading along the caravan routes of Africa, devastating four countries on the West Coast.

In the two-year period of 2010-2011, the Gates Foundation paid over \$446 million to the WHO, which was more than any other government contributor after the United States: a figure 24 times higher than the contributions made by Brazil, Russia, India, China and South Africa (the Brics countries) combined⁵³. In 2013 it settled as the first absolute donor (in front of all governments) and as the first voluntary donor in 2015⁵⁴. At the end of 2017 it is in second position with over 600 million dollars (11% of the total budget)⁵⁵, and not counting the flow of funds to the WHO from Seattle through GAVI and other public-private entities.

To sum them all up, it is to be suspected, with some reasonableness, that the Gates have held the golden share of the organization's funding for nearly a decade now. That is why it should come as no surprise that the Gates Foundation's priorities have gradually become the priorities of the WHO. Against all scientific evidence, the polio eradication program - which has always been a U.S. priority and is widely supported by the Gates Foundation - is the lion's share of the 2016-2017 budget of the WHO (35.2% of the budget). This item has been boosted in the 2019-2023 budget⁵⁶, with the effect of diverting even more funds from more pressing health priorities - in 2017, there were 22 polio cases worldwide⁵⁷ - as well as triggering poor management at the WHO, which is forced to use the polio program to pay nearly 20 percent of WHO staff at about 1300 people⁵⁸.

⁵³ Dentico N., "La riforma dell'Oms: tutta una questione di soldi", in *Oms e diritto alla salute: quale futuro*, 5° Rapporto dell'Osservatorio Italiano sulla Salute Globale, by Adriano Cattaneo and Nicoletta Dentico, May 2013, p. 189.

The Gates Foundation and the production of scientific knowledge

Another critical issue concerns the interference of Gates funds in the production of scientific knowledge and literature. The subjection of the research community to the foundation's priorities in the health sector - a syndrome that reproduces itself in the selection of funding areas in the field of agriculture - is now an established fact. We know that several members of the scientific community, when the microphones are off, criticize Bill Gates harshly for his obsession to impose the Silicon Valley business model on health care and his unconditional preference for technology.⁵⁹

When the Gates Foundation swoops in on a disease, it has no difficulty in soliciting the commitment of governments and other philanthropic entities to the cause, and in redesigning the world's research agenda.

This is what happened with polio. In 1988, the WHO had undertaken a commitment to eradicate polio by the year 2000, thereby drastically reducing the number of cases but missing the target. Sensing the opportunity, Bill Gates invested more than \$3 billion since 2003 on polio, only to become the largest funder of eradication programs. This included the WHO, UNICEF, and the Centre for Disease Control (CDC) in Atlanta in 2008.

This process enabled him to relaunch the elimination approach on other diseases as well. Malaria is a typical case. The Gates began to take an interest in malaria, and to fund research projects, first by revitalizing activities against the disease and then with the precise intention of changing the strategy of the international community. At the foundation's forum in 2007, Melinda Gates left the scientific community working on malaria astonished, challenging the control strategy and launching the commitment to eradicate the disease⁶⁰.

Despite the scepticism of many researchers, convinced that the elimination of malaria was a project destined to fail, the Gates began to inject so much money - a billion dollars in research projects by 2007 - into this goal so as to silence the scientific community, with few exceptions.

Without consulting her experts, WHO director Margaret Chan immediately adhered to the Gates strategy, but at the beginning of 2008 the authoritative voice of Kochi Arata, head of the malaria programme at WHO, expressed his disagreement in a note to Chan.. Arata complained in that note about the growing domination of the Gates Foundation in malaria research, a dominion that according to him was challenging the necessary diversity of approaches and opinions of the scientific community, and threatened to undermine the leading

⁶⁰ Roberts, Leslie, and Martin Enserink. "Did They Really Say ... Eradication?" *Science* 318, no. 5856 (December 7, 2007): 1544–1545, <https://www.ghdonline.org/uploads/1544.full.pdf>

role of the WHO⁶¹. This bold stance was intended to alert the WHO about the fact that the flow of money from the Gates Foundation, "though crucial, could have long-range, largely undesirable consequences" because it ended up "capturing the world's best malaria scientists in a single 'cartel'", so that "everyone has a vested interest in safeguarding each other's research [...] and the result is that independent review of the scientific evidence is becoming increasingly difficult". In this way, the creativity of research was damaged, something that "could have dangerous consequences for decision-making on global health policies"⁶². Margaret Chan unfortunately decided to liquidate Arata shortly after this episode, and at the WHO there have been no more explicit voices of criticism of the Gates Foundation's role in the field of malaria since Arata's removal. Bill and Melinda are thus given a technical role.

But they are also granted an almost salvific profile in institutional bodies: in ten years, the WHO has invited Bill & Melinda Gates three times to open the World Assembly in Geneva (in 2005, 2011 and 2014)⁶³. A symbolic repetition that contributes to validate the model of public-private initiatives conceived in Seattle as the only way to stay with some entitlement on the scene⁶⁴ and not be marginalized.

Not everyone got adjusted to this. In the same period of the malaria querelle, two South African researchers published in the prestigious journal *Science* an article that explicitly spoke of "scientific imperialism" of public-private initiatives, which are designed according to a Western cosmology, that completely conditions the strategy of intervention on infectious diseases, that was aimed at eradicating in the most radical disregard of the scientific knowledge and skills of the world's south⁶⁵.

⁶⁴ The Gates Foundation has promoted the approach by also supporting evaluation studies on scientific research conducted through public-private partnerships. For example, it commissioned several surveys from McKinsey on the determinants of the effectiveness of partnerships with the private sector. In 2014, it awarded \$7.5 million to Population Services International "to demonstrate the benefits of engaging the private sector to meet India's 2020 family planning goals, and to improve the knowledge of key Indian influencers and policy makers about the need for efficient public-private alliances in the field of family planning", in Marten J. e Saetz K., op cit., p. 37-38.

SECTION 6

**ONE EMPIRE OVER THE EARTH:
AMPLIFYING CLIMATE CHANGE,
ACCELERATING THE SIXTH MASS EXTINCTION**

THE SUGAR DADDY OF GEOENGINEERING: BILL GATES' FOSSIL FUEL INTERESTS AND FUNDING FOR GLOBAL CLIMATE ENGINEERING

Dru Jay and Silvia Ribeiro, ETC Group

Bill Gates' approach to our planet's climate is designed to appear sensible, even-handed, and evidence based. A closer look, however, reveals a powerful billionaire with a deep attachment to techno-solutions that don't interfere with the normal functioning of capitalism – and a large financial stake in the continued extraction of fossil fuels.

In a 2010 TED talk, Gates outlined, in carefully crafted messages, what he considered the most effective solutions to climate change¹. His approach, titled “Innovating to Zero” centred on five “energy miracles” he believes the earth needs to avoid catastrophic temperature increases. In Gates' view, those technologies are carbon capture and storage, nuclear energy, wind power, solar power, and solar thermal.

Gates presents the technologies, noting the drawbacks and potential of each one. He makes a show of deferring to evidence and science in each case. This is typical of Gates' rhetoric. A posture of disinterested curiosity shows up in all his public appearances; it is effective and disarming.

As a sort of afterthought to the TED talk, Gates answers a question about solar geoengineering—the idea that engineers could block enough sunlight to offset global temperature increases—with a carefully-prepared answer and an elaborate metaphor:

“If this doesn't work, then what? Do we have to start taking emergency measures to keep the temperature of the earth stable?”

“Yeah, if you get into that situation—it's like, if you've been overeating and you're about to have a heart attack, then where do you go? You may need heart surgery or something. There is a line of research on what's called geoengineering, which are various techniques that would delay the heating to buy us 20 or 30 years to get our act together. Now that's just an insurance policy—you hope that you don't need to do that. Some people say you shouldn't even work on the insurance policy because it might make you lazy, that you'll keep eating because you know heart surgery will be there to save you. I'm not sure that's wise, given the importance of the problem. But now that the geoengineering discussion about 'should that be in the back pocket in case things happen faster or this innovation goes a lot slower than we expect'—...”.

¹ “Innovating to Zero! | Bill Gates - YouTube.” <https://www.youtube.com/watch?v=JaF-fq2Zn7I>

Perhaps disingenuously, Gates leaves the last sentence unfinished. At the time of the talk, Gates had already been funding geoengineering research with millions of dollars for several years.² Geoengineering refers, essentially, to attempts to stop global temperature increases by blocking the sun or sucking carbon out of the air on a massive, global scale—instead of reducing carbon emissions to zero. The potential risks run the gamut from unexpected feedback effects that destabilize the global climate, to droughts and floods in Africa and South America, to land grabs, ecological destabilization, ocean acidification, pollution and growing the political and financial power of the fossil fuel industry. This is a high risk strategy: the consequences we know about are massive, the ones that are unknown could be more so. The process could alter weather patterns locally, regionally and globally, with destabilising geopolitical impacts as well.

In fact, Gates has, through personal funding and investments, been one of the major backers of the most extreme forms of geoengineering research for more than a decade. Prominent geoengineers like Ken Caldeira and David Keith are among his close advisors, and his donations are supporting some of the most controversial proposed experiments.

Gates' heart attack metaphor is flawed in a number of ways. Unlike heart surgery, geoengineering has never been done before, and there is only one patient to try it out on: the planet. Geoengineering is more akin to administering a massive dose of a hypothetical, untested medication that one is certain will have permanent negative effects. In this metaphor, one is uncertain which effects will happen, but there is potential for organ failure, psychosis, or death. In the same way, geoengineering—if implemented—will have global effects covering a range of severity from destructive to fatal, from unanticipated climate destabilization to continental crop failures. The problem is that we don't know which one will happen, and the only way to properly "research" the question is to take that one shot.

Gates' engineering-for-everything mentality and his preference for purely technological solutions are well-known. And like many billionaires, Gates has a blind spot when it comes to questioning the logic of capitalism. Nearly every solution Gates proposes for the climate centres on "innovation" by entrepreneurs, driven by the promise of profits.

But hidden behind Gates' carefully cultivated persona of detached curiosity on climate solutions are significant financial interests in fossil fuel extraction.

For example, at the time of his 2010 TED Talk, Gates had already been a major shareholder in Canadian National (CN) Railroads for at least four years. CN was—and is—making big profits by shipping crude oil from Canada's tar sands to market. Rapidly-expanding tar sands extraction has been stymied by a number of campaigns led by Indigenous communities and climate activists to stop construction and expansion of pipelines. In this context, Canada's railroads (of

² *The Planet Remade: How Geoengineering Could Change the World*, by Oliver Morton (2015), page 102

which CN is one of two major operators) have become an alternative oil pipeline, shipping over 400,000 barrels per day in January 2020³. For comparison purposes, the Trans-Mountain Pipeline that Canada's government is attempting to expand currently has a capacity of 300,000 barrels per day.

"Tar sands, Alberta (2008)", by Dru Oja Jay, Dominion, is licensed under CC BY 2.0 (<https://creativecommons.org/licenses/by/2.0/>).

Tar sands operations are among the dirtiest and most environmentally destructive forms of fossil fuel extraction. In some cases, the land is strip mined to remove the bituminous sand below. The 2013 explosion of an oil train killed 42 people in Quebec⁴. In the aftermath, despite posting record profits, CN has pushed its workers to work longer hours and dismissed safety concerns from union representatives⁵.

Since 2011, Gates has been the single largest shareholder in CN, and his holdings have increased over time. Through Cascadia Investment Fund⁶, which he controls, and through the Bill and Melinda Gates Foundation, he has gradually

⁶ "Cascade Investment." *Wikipedia*, June 16, 2020. https://en.wikipedia.org/w/index.php?title=Cascade_Investment&oldid=962804357

increased his holdings of CN stock to 16.7% of the company⁷. That means that in 2019, Gates' Cascadia and the Foundation received⁸ around US\$190 million in dividends alone.⁹ Steep growth¹⁰ in oil-by-rail exports has accounted for the company's record-high profits and steady profit growth¹¹.

Though Gates has sold a lot of his holdings in Microsoft, he still owns about US\$70 billion in stock of the now-US\$1 trillion company. Microsoft has invested heavily in pursuing oil giants, signing deals with Exxon Mobil, Chevron, Shell, and BP¹². Despite a recent pledge to be "carbon negative by 2030," the company's cloud services web site advertises "oil and gas solutions" that will "increase drilling hit rates," "improve reservoir production" and "extend asset life cycles¹³." In other words, they're helping oil companies extract more oil, at a time when we should be doing anything but. (And according to a former employee, Microsoft allegedly also helped oil companies to conduct surveillance of their workers¹⁴).

Gates is not a disinterested observer seeking solutions to the climate crisis. In addition to being a billionaire who made his fortune skirting government regulations and dominating competitors with monopolistic practices, he holds a very significant financial stake in the continued expansion of the fossil fuel industry. His shares in CN Rail alone are worth US\$10.9 billion.¹⁵

If the planet stays within what scientists say is our maximum "carbon budget," oil companies will see vast assets disappear from their balance sheets – estimated at between \$1 trillion and \$4 trillion. This is the "carbon bubble."¹⁶

Geoengineering is the fossil fuel industry's final escape hatch—its only chance to keep on extracting and burning in order to recuperate some of those US\$1.6 trillion in soon-to-be stranded assets.

¹⁵ 118,527,644 shares at a value of CAD\$125.06 is CAD\$14.8 billion, or US\$10.9 billion (based on share prices and conversion rates of July 15, 2020).

¹⁶ Fiona Harvey Environment correspondent, "What Is the Carbon Bubble and What Will Happen If It Bursts?" *The Guardian*, June 4, 2018, sec. Environment. <https://www.theguardian.com/environment/2018/jun/04/what-is-the-carbon-bubble-and-what-will-happen-if-it-bursts>

According to a report from CIEL, since the 1970s, oil companies have been investing in and supporting geoengineering¹⁷. However, they have kept a lower profile when it comes to more extreme forms of solar geoengineering (i.e. blocking sunlight).

Into this void has stepped Bill Gates, who's carefully cultivated philanthropic image appears to be a relative public relations coup for the fossil fuel players who would like to drive geoengineering but can't show their faces.

Climate geoengineering refers to large-scale human intervention in the climate, and it includes projects that could alter marine and terrestrial ecosystems and atmosphere.

Geoengineers have divided these into two major categories: carbon dioxide removal (the idea of removing CO₂ from the air on a massive, global scale, which appears on Gates' list of "miracle" technologies) and solar geoengineering (the idea of blocking a portion of sunlight to temporarily cool the planet).

Carbon Dioxide Removal (CDR) proposals are the more mainstream of the two; there are dozens of research projects running around the world but so far they either haven't proven that they can remove any CO₂, or only that they remove currently tiny amounts of CO₂ from the air – while being too energy-intensive and

¹⁷ "Fuel to the Fire: How Geoengineering Threatens to Entrench Fossil Fuels and Accelerate the Climate Crisis (Feb 2019)." *Center for International Environmental Law*, n.d. <https://www.ciel.org/reports/fuel-to-the-fire-how-geoengineering-threatens-to-entrench-fossil-fuels-and-accelerate-the-climate-crisis-feb-2019/>

expensive to make sense. Their proponents speculate, however, that they will eventually remove billions of tonnes per year from the atmosphere, either storing it underground or using it to produce synthetic fuels (in which case it ends up in the atmosphere again).

Direct Air Capture (DAC) is a form of CDR where fans suck in vast amounts of air, push it through substances that absorb carbon dioxide molecules, and then process the substances to remove the carbon. The processes of removing the carbon require high heat, and thus large amounts of energy.

Bio-Energy with Carbon Capture and Storage (BECCS) is another form of CDR. It involves growing biomass (e.g. wood), burning it in a power plant, capturing the carbon (using a similar process to DAC) before it enters the atmosphere, and then storing it underground. In theory, carbon is thus removed from the atmosphere by plant growth, and kept out when it is buried. However, many questions have been raised about the full-life-cycle impacts of BECCS, as it would demand millions of hectares of land (by one estimate the equivalent of the entire landmass of India). Its land and water needs would severely compete with food production, and devastate ecosystems. Though it has been discredited in many climate circles, it persists as a policy idea and has been prominently featured by the Intergovernmental Panel on Climate Change (IPCC) in its Fifth Assessment Report.

Carbon Capture and Storage (which generally refers to capturing carbon before it is emitted) is on Gates' list of "miracle" technologies that need to be developed. It's also at the top of oil companies' wishlists. The top investors in CCS technologies have been oil companies, who own much of the intellectual property around related techniques. Microsoft's plan to achieve "net zero" emissions lean heavily on unidentified carbon removal techniques to offset the company's fossil fuel use¹⁸.

Along with tar sands billionaire N. Murray Edwards and Chevron, Gates is a major investor in Carbon Engineering, a Canada-based Direct Air Capture firm. CE's founder and chief scientist David Keith, a Gates advisor since the mid-2000s, is at the centre of what journalist Eli Kintisch called the "geoclique"—a small group of people who are driving geoengineering¹⁹.

There are some – including the IPCC – who don't consider carbon dioxide removal to be geoengineering. If, however, these projects were to reach the proposed scale, in order to really influence the climate, the impacts would be global and profoundly negative. Many CDR proposals require massive amounts of energy to function, and its rapid growth could slow the climate transition. It also requires massive infrastructure, and some forms (e.g. Bio-Energy with Carbon Capture and Storage, or BECCS) require land covering the equivalent of several

¹⁹ Hamilton, Clive. "The Clique That Is Trying to Frame the Global Geoengineering Debate | Clive Hamilton." *The Guardian*. Last modified December 5, 2011. <http://www.theguardian.com/environment/2011/dec/05/clique-geoengineering-debate>

countries. Storage of billions of tonnes of carbon raises major questions about leaks, pollution, and the massive infrastructure required.

Keith is also the most well known advocate for solar geoengineering, a term that covers various efforts to block sunlight from reaching earth or reflect it back into space on a massive scale. Along with Ken Caldeira, he manages the Fund for Innovative Climate and Energy Research (FICER)²⁰. Gates had given FICER at least US\$4.6 million as of 2012, and further donations are unknown, though the web site notes that research grants come from “Bill Gates from his personal funds” (i.e. not the Bill and Melinda Gates Foundation).

For years, FICER was the main source of financing for research related to solar geoengineering. Two of the North American solar geoengineering projects that are closest to testing—Keith’s SCoPEX, and the California-based Marine Cloud Brightening Project—have received funding from FICER. According to a 2012 *Guardian* report²¹, about half of FICER’s funding was then going to Caldeira and Keith’s projects, but it had also funded an initiative to advance governance of solar geoengineering (SRMGI)²², and contributed to a Novim report on geoengineering, which was convened by Dr. Steven E. Koonin, Chief Scientist for multinational oil and gas company BP²³.

Keith’s current research project is the Stratospheric Controlled Perturbation Experiment (SCoPEX), an attempt to conduct an open-air test of solar geoengineering technology by spraying various substances into the stratosphere from a balloon. The experiment has been repeatedly delayed, but if it moves forward, it would be a violation of the provisions of the moratorium on geoengineering passed by the 196 countries who are party to the United Nations Convention on Biodiversity.

In his book *The Planet Remade*, journalist Oliver Morton calls Gates the “sugar daddy” of geoengineering (p. 156) and concludes that

“Keith and Caldeira would have been leaders in the field based on their work but having this fund at their disposal gave them extra heft. It has allowed them to support work that would otherwise not have been supported, and create space for discussions that might otherwise not have taken place.” (p. 157)

Because changing the amount of sunlight that reaches earth is so dangerous and difficult to understand without doing it at scale and over a long period of time, solar geoengineering has received less mainstream discussion—for

now. Few open-air tests of solar geoengineering have been announced. Of those announced, most have been cancelled or delayed after opposition and protests.

David Keith's favoured proposal is to spray tens of thousands of tonnes of aerosols, potentially sulphur dioxide, into the stratosphere, blocking sunlight before it reaches the earth. Keith, who according to the same *Guardian* report, received direct annual funding from Gates circa 2012, wrote a book advocating for solar geoengineering. He took a strategy of embracing the shocking nature of spraying tens of thousands of tonnes of "sulphuric acid" into the stratosphere, defending the position that "we need to talk about it". He even allowed himself to be the butt of several cruel jokes on the satirical show the Colbert Report in order to convey his ideas, which he describes as a last resort if other climate strategies fall through²⁴.

Another one of Gates' connections to geoengineering stretches back to 1986, when Nathan Myhrvold joined Microsoft when his company was acquired by Gates' software giant. Myhrvold was a close collaborator for 14 years. "I don't know anyone I would say is smarter than Nathan," Gates told a reporter in the 1990s. "He stands out even in the Microsoft environment." Myhrvold is also a geoengineering enthusiast, and a proponent of injecting the stratosphere with sulphur dioxide.

Myhrvold reportedly took Bill Gates and Warren Buffet on a tour of Canada's tar sands mining operations²⁵. One of the byproducts of tar sands processing is vast quantities of sulphur, which is stored in giant yellow pyramids outside of the Syncrude refinery, viewable from the highway. Myhrvold marvelled at the possibilities of burning that sulphur to make sulphur dioxide, and pumping it into the stratosphere via a hose suspended from a series of balloons.

"So you can put one little pumping facility up there," Myhrvold enthused, "and with one corner of one of those sulfur Mountains, you control the whole global warming problem for the Northern Hemisphere." That idea forms the basis for "Stratoshield," a project of Myhrvold's Intellectual Ventures, an investment fund that seeks to profit from inventions that anticipate trends and future developments. The Stratoshield consists of a very long hose—30 kilometres long—stretching from the ground to the stratosphere with balloons, each of which houses a small pumping station that would keep a steady stream of sulphur dioxide flowing into the sky. A "string of pearls," in Myhrvold's words, that would "spritz the stratosphere with a fine mist," a veil of 100,000 tonnes per year of sulphur dioxide that would encircle the planet.

Who is behind the "Stratoshield"? It's unclear, but FICER co-director Ken Caldeira works as an "inventor" for Intellectual Ventures and has co-authored a

²⁴ "David Keith - The Colbert Report (Video Clip)." *Comedy Central*. <http://www.cc.com/video-playlists/kw3fj0/the-opposition-with-jordan-klepper-welcome-to-the-opposition-w--jordan-klepper/lv0hd2>

²⁵ "Superfreakonomics: Everything You Know about Global Warming Is Wrong." *Carolina Huddle*. <https://www.carolinahuddle.com/boards/topic/34241-superfreakonomics-everything-you-know-about-global-warming-is-wrong/>

paper with Myhrvold²⁶. Caldeira has also speculated publicly that a government of a “vulnerable country” like Bangladesh could unilaterally implement solar geoengineering²⁷. In addition to the stratospheric shield, Intellectual Ventures has also proposed weather modification technology using ocean cooling²⁸.

In a chapter of the book *Superfreakonomics*, which sold over 7 million copies, Myhrvold discusses climate at length with the authors, and makes the case for injecting sulphur into the stratosphere. After quoting Myhrvold for several pages on the theme of “*Everything you know about Global Warming is wrong*,”²⁹ the authors reach the conclusion that reducing carbon emissions doesn’t make sense. Spending money on “*anti-carbon initiatives, without thinking things through*” would be “*a huge drag on the world economy*.” What would work?. “*Once you eliminate the moralism and the angst*,” the authors say about Myhrvold’s “Stratoshield” plan, “*the task of reversing global warming boils down to a straightforward engineering problem*.”

Gates, who is still close with Myhrvold, has invested in Intellectual Ventures, which includes “Stratoshield” under its umbrella of inventions. He and Myhrvold appear to share the view that capitalism is the main force that will lift—and has lifted—the poor people of the world out of poverty³⁰.

Myhrvold later backtracked and denied portraying solar geoengineering as a solution. He now opts for the more politically correct “it’s a last resort” approach.

The “last resort” rhetoric echoes how Gates talks on the rare occasions when he speaks about his support for geoengineering. But the facts outlines here—the much more aggressive pro-geoengineering stance portrayed in *Superfreakonomics*, coupled with Myhrvold’s proximity to Gates, and Gates’ investments in transportation of tar sands oil—raise significant questions about Gates’ real privately-held views about geoengineering technologies, and what is driving his investments in them.

DRIVEN TO EXTERMINATE: HOW BILL GATES BROUGHT GENE DRIVE EXTINCTION TECHNOLOGY INTO THE WORLD

Zahra Moloo and Jim Thomas, ETC Group

In 2016, at the Forbes 400 Summit on Philanthropy in New York, Bill Gates was asked to give his opinion on gene drives, a risky and controversial new technology that could—by design—lead to the complete extermination of the malaria-carrying mosquito species, *Anopheles gambiae*. If it were his decision to wipe out this mosquito once and for all, given the risks and benefits being considered, would he be ready to do it? “I would deploy it two years from now,” he replied confidently. However, he added, “How we get approval is pretty open ended.”

Gates's ‘let’s deploy it’ response may not seem out of character, but it was an unusually gung-ho response given how risky the technology is widely acknowledged to be. Gene drives have been dubbed an “extinction technology” and with good reason: gene drive organisms are created by genetically engineering a living organism with a particular trait, and then modifying the organism’s reproductive system in order to always force the modified gene onto future generations, spreading the trait throughout the entire population.

In the case of the *Anopheles gambiae* project (that Gates bankrolls), a gene drive is designed¹ to interfere with the fertility of the mosquito: essential genes for fertility would be removed, preventing the mosquitoes from having female offspring or from having offspring altogether. These modified mosquitoes would then pass on their genes to a high percentage of their offspring, spreading auto-extinction genes throughout the population. In time, the entire species would in effect be completely eliminated².

Although still new and unproven, gene drives have provoked significant alarm among ecologists, biosafety experts and civil society, many of whom have backed a call for a complete moratorium on the technology. By deliberately harnessing the spread of engineered genes to alter entire populations, gene drives turn on its head the usual imperative to try to contain and prevent engineered genes from contaminating and disrupting ecosystems. The underlying genetic engineering technology is unpredictable and may provoke spread of intended traits. The notion that a species can be removed from an ecosystem without provoking a set of negative impacts on food webs and ecosystem functions is wishful thinking and even taking out a carrier of an unpleasant parasite does not mean the parasite won’t just jump to a different host. Moreover, the implicit power in being able to re-model or delete entire species and ecosystems from the

genetic level up is attracting the interest of militaries and agribusiness alike and runs counter to the idea of working with nature to manage conservation and agriculture.

That Gates is so enthusiastic about releasing this powerful genetic technology is not so surprising when one scratches the surface of the myriad institutions that have been researching and promoting gene drives for years. To date, the Bill and Melinda Gates Foundation (BMGF) is either the first or second largest funder³ of gene drive research (alongside the shadowy U.S. Defense Advanced Research Projects Agency (DARPA) whose exact level of investment is disputed⁴). Gates is not just another tech optimist standing on a business stage calling for gene drive release to be allowed—his foundation has poured millions of dollars into gene drive research for over a decade. Yet direct research funding is not the only way in which the BMGF has accelerated the development of this technology. They have also funded and influenced lobbyists, regulators, and public narratives around gene drives, in an attempt to push this dangerous sci-fi sounding technology into real world use, shifting research priorities on industrial agriculture, conservation and health strategies along the way.

Funding the Research

While the controversy around gene drives is recent, promoters like to emphasize that research towards creating gene drive technology has been in the works for many years. From its inception, much of this research has received direct funding from the BMGF, funneled through different academic institutions. The beginning of current research into genetically modified extinction technology can be traced back to 2003 when Austin Burt, a professor of Evolutionary Genetics at Imperial College in London, was working with yeast enzymes, noting how 'selfish genes' were able to reproduce with a greater probability than the usual 50-50 ratio that occurs in normal sexual reproduction. In a paper, he explained how these genes could be adapted for other uses, such as in mosquitoes, where the destruction of the insects could be embedded directly into their genes. Burt, along with Andrea Crisanti, another biologist at Imperial College, applied for a US\$8.5 million grant from the Bill and Melinda Gates Foundation (which they received in 2005) to take forward their theories and apply them in a lab, eventually creating an international project called 'Target Malaria'. In an interview with *Wired* magazine⁵, Crisanti explained how this funding and the relationship with the BMGF was instrumental in the further development of gene drives technology. "If you need a resource, you get it, if you need a technology, you get it, if you need equipment, you get it. We were left with the notion that success is only up to us," he said.

⁵ O'Mahony, Jennifer. "Science Moves Closer to Killing Malaria with Mutant Mosquitos." *Wired UK*, n.d. <https://www.wired.co.uk/article/mosquito-gene-drive-malaria>

At the same time, in 2005, the BMGF was also channeling money into the Foundation for the National Institutes of Health (FNIH), as part of a larger US\$436 million grant for a project called the Grand Challenges in Global Health Initiative. Through the FNIH, a biologist at UC Irvine, Anthony James, was injecting DNA into mosquito embryos⁶ to create transgenic mosquitoes resistant to dengue fever. These mosquitoes were able to reproduce which meant that normal mosquito populations could possibly be replaced by GM mosquitoes if only a way could be found to drive the engineered genes into populations. In 2011, James' lab genetically engineered the mosquito species *Anopheles stephensi* with genes that made it resistant to malaria.

All these developments were significant, but they had not yet led to the creation of gene drives. That moment came in 2015, when two scientists at UC San Diego, California, Ethan Bier and Valentino Gantz, created a gene-construct that could spread a trait through fruit flies, turning the entire population yellow. The technology they had developed used a new genetic engineering tool called CRISPR-Cas9 which could cut DNA and enable genes to be inserted, replaced or deleted from DNA sequences⁷. In effect Gantz and Bier built the genetic engineering tool directly into the flies' genome so each generation genetically engineered its offspring. CRISPR-Cas9 technology was instrumental in the creation of the gene drive and in late 2015, functional gene drive modified mosquitoes

were created. This is what the Gates Foundation was waiting for. In 2016, an official with the Gates Foundation said in an interview that malaria could not be wiped out without a gene drive; all of a sudden this 'extinction technology' was considered not just desirable, but "necessary" in the fight to end malaria.

Since then, the push for further research and deployment of gene drives has gained considerable momentum—mostly propelled by Gates dollars. The BMGF has funneled even more funding into taking gene drive research forward. In 2017, UC Irvine received another US\$2 million directly from the BMGF for Anthony James to genetically engineer the malaria-carrying mosquito species *Anopheles gambiae*, with a view to eventually releasing them in a trial⁸. Meanwhile, Target Malaria, the flagship research consortium that came from Burt and Crisanti's work, has received US\$75 million from the foundation⁹. This has been used to create labs in Burkina Faso, Mali and Uganda in order to begin experimenting with gene drives in Africa, and in 2019 Target Malaria released 4,000 genetically modified (not gene drive) mosquitoes in Burkina Faso as a first step in their experiment. Their goal is to release the gene drive mosquitoes in Burkina Faso in 2024. BMGF has also bankrolled further gene drive research in Siena Italy, Jerusalem, Israel and Boston, USA¹⁰.

Synthetic Biology and Agricultural Interests

Although mainstream media coverage of gene drive developments emphasizes Gates's grandiose philanthropic intentions in eliminating malaria and saving lives in Africa, there is more than meets the eye when it comes to Gates's direct funding of gene drive research.

Gene drives are classified as part of a controversial field of extreme genetic engineering known as synthetic biology (synbio) or 'GMO 2.0' in which living organisms can be redesigned in the lab to have new abilities¹¹. Synthetic Biology aims to redesign and fabricate biological components and systems that do not exist in the natural world¹². Today it is a multi-billion-dollar industry which creates compounds like synthetic ingredients (synthetic versions of saffron, vanilla etc), medicines and lab-grown food products. Gates's ambitions for this radical biotech field extend beyond gene drives and malaria research and into the field of synbio. In an interview, he said that if he were a teenager today, he would be hacking biology: "If you want to change the world in some big way, that's where you

should start—biological molecules.”¹³

The Gates Foundation has had a substantial influence on the synthetic biology industry since its inception. In 2005, when the field was still relatively new, the BMGF gave a grant of US\$42.5 million (and later more) to the University of California Berkeley and Amyris, a startup synbio company, in order to produce the antimalarial drug artemisinin in a laboratory with genetically engineered microbes¹⁴. The aim of this grant was not only to create the antimalarial drug, but also to create new biofuels, medicines and high value chemicals. The founder of Amyris, Jay Keasling, has told ETC Group that the Gates funds were contingent on finding other more profitable lines of business in addition to artemisinin and so initially the technology was simultaneously applied to biofuel production. Jack Newman, a scientist at Amyris explained that “the very same pathways” used in artemisinin “can be used for anticancer (drugs), antivirals, antioxidants.”¹⁵

While using philanthropic funds to bankroll a private biofuel business might seem ethically questionable, the supposedly beneficial target of making an antimalarial molecule may not have been so positive either. In 2013, after many years of research by the UC Berkeley Laboratory and Amyris, it was announced that the French pharmaceutical company, Sanofi, would launch the production of synthetic artemisinin¹⁶. Commercial production of the compound was hailed as more affordable than naturally grown artemisinin, which is farmed in countries like Kenya, Tanzania, Madagascar, Mozambique, India, Vietnam and China. However, what was not mentioned during all the hype around the synthetic production of the compound was that artemisinin farmers in these countries would lose their livelihoods as a result of the sale of the synbio version¹⁷. In the hype and supported by philanthropic money, prices for artemisinin crashed and some natural artemisinin extractors were shuttered. Eventually, even the synthetic product proved too expensive to sell¹⁸.

The BMGF investments' in syn bio go further still. The Foundation invested in a number of other synbio companies including Editas Medicine, a genome editing company that controls the CRISPR-Cas9 technology behind gene drives, and Ginkgo Bioworks, which creates microbes for application in fashion, medicine and

¹⁸ Peplow, Mark. “Synthetic Biology’s First Malaria Drug Meets Market Resistance.” *Nature News* 530, no. 7591 (February 23, 2016): 389. <https://www.nature.com/news/synthetic-biology-s-first-malaria-drug-meets-market-resistance-1.19426>

industry¹⁹. Gates is also keen on the so-called “cellular food revolution” which grows food from cells in a lab. His investments in the sector include Memphis Meat, a company that creates cell-based meat without animals, Pivot Bio, which creates engineered microbes for use in agriculture, and Impossible Foods, which makes processed meat-like burgers from a synthetic biology-derived blood substitute.

That Gates is pouring so much money into an industry that is oriented toward shifting agriculture and the food systems toward hi-tech approaches is no accident, given how influential the Foundation is in global health and agriculture policy generally, and in promoting industrial agriculture in the global South and

especially Africa. In the case of gene drives, while most international debate has focused on their application in malaria and conservation, the industrial farm is where gene drives may first make their impact²⁰; the very foundational patents for gene drives have been written with agricultural applications in mind. In 2017, a secretive group of military advisors known as the JASON Group produced a classified study on gene drives commissioned by the US government which was tasked to address “what might be realizable in the next 3-10 years, especially with regard to agricultural applications.” The JASON Group was also

informed by gene drive researchers who were present during a presentation on crop science and gene drives delivered by someone from Bayer-Monsanto. Other groups involved in gene drive discussions behind the scene include Cibus, an agricultural biotech firm, as well as agribusiness majors including Syngenta and Corteva Agriscience.

The startup Agragene, whose co-founders are none other than the gene drive researchers Ethan Bier and Valentino Gantz of University of California at San Diego, “intends to alter plants and insects” using gene drives. The JASON Group and others have also raised the flag that gene drives have biowarfare potential—in part explaining the strong interest of US and other militaries in the technology.

Shaping the Narrative Around Gene Drives

Not only has the Gates Foundation funded the underlying tools of the synbio industry and moulded gene drive research for years, it has also been quietly working behind the scenes to influence the adoption of these risky technologies. The way in which policy and public relations about gene drives research has been shaped by the Foundation becomes clear when one examines what happened

¹⁹ Cumbers, John. “Meet Eight Tech Titans Investing In Synthetic Biology.” *Forbes*. Last modified September 14, 2019. <https://www.forbes.com/sites/johncumbers/2019/09/14/meet-the-8-tech-titans-investing-in-synthetic-biology/>

immediately after the creation of the first functional gene drives with CRISPR Cas9 technology in late 2014.

In early 2015, the US National Academies of Science, Engineering and Medicine announced that they would have a major inquiry into gene drives—an unprecedented move for such a brand new (only months old) technology. The study did not explore just the science of gene drives, but also aimed to frame issues around policy, ethics, risk assessment, governance and public engagement around gene drives²¹. It was sponsored by the Defense Advanced Research Projects Agency (DARPA) and The Bill & Melinda Gates Foundation, through the National Institutes of Health (NIH) and the Foundation for the National Institutes of Health (FNIH). Several panel members were recipients of Gates funds.

Source: ETC Group²²

The Foundation has also channeled money into the MIT media lab, home to Kevin Esvelt, who directs a group called Sculpting Evolution and was among the first people to identify the potential of CRISPR-based gene drive to alter wild populations²³. Last year the MIT Media Lab was embroiled in a controversy when it was revealed that it had received donations from the convicted sex offender

Jeffrey Epstein. Through Epstein, the media lab secured US\$2 million from Gates although it is not clear for which project²⁴.

One of the most controversial findings which illustrate the extent to which the Gates Foundation is invested in influencing the uptake of gene drive technology was made in 2017 by civil society organizations following a Freedom of Information request. That process led to the release of a trove of emails revealing that a private PR firm called Emerging Ag, was paid US\$1.6 million by the BMGF²⁵. Part of their work involved coordinating the “fight back against gene drive moratorium proponents,” as well as running a covert advocacy coalition to exert influence on the United Nations Convention on Biological Diversity (CBD), the key body for gene drive governance. After calls in 2016 for a global moratorium on the use of gene drive technology, the CBD sought input from scientists and experts in an online forum²⁶. Emerging Ag recruited and coordinated over 65 experts, including a Gates Foundation senior official, a DARPA (Defense Advanced Research Project Agency) official, and government and university scientists, in an attempt to flood the official UN process with their coordinated inputs.

good."³⁰ Its members include researchers and organizations that work on gene drive research, stakeholder engagement, outreach and even funders. Almost all of its members are separately funded by the Gates Foundation. In 2020, Emerging Ag received another grant from the Foundation for \$2,509,762.

Governance and Lobbying at International Fora

During the international negotiations of the Convention on Biological Diversity (CBD) COP14 in Sharm el Sheikh in 2018, the influence of the Gates machinery was on clear display. The multiple initiatives in which the Foundation had invested beforehand ended up having important consequences. Not only had the Foundation sought to influence the expert panels that inform the Convention before the actual negotiations took place, but they had also managed to ensure that political support for gene drives in Africa, where the first gene drive mosquitoes are due to be released, was established well before the official negotiations, countering civil society concerns about and resistance to this highly risky technology.

About six months prior to COP14, the African Union's technical arm, the New Partnership for Africa's Development (NEPAD) released a report in support of gene drive mosquitoes for malaria eradication. A year prior to the report, NEPAD was awarded \$2,350,000 from the Open Philanthropy Project, a major co-funder of Target Malaria alongside BMGF, to support the evaluation, preparation and possible deployment of gene drives. Open Philanthropy's funding priorities often move in lockstep with BMGF priorities and they are part of the same 'effective altruism' movement of technocratic billionaires. Additionally, a new crop of African negotiators, new to the CBD, arrived at the Sharm-el-Sheikh negotiations vocally arguing in favour of gene drives. Many of this new cohort were drawn from ABNE, the African Network on Biosafety Expertise—a Gates funded biotech policy network on the African continent that is at the heart of BGMF influence on African biotech policy. It was no surprise then when, at the CBD, the consensus position of the African group of delegates was one that was in favour of gene drives, and they blocked a moratorium on the release of gene drive organisms which was requested by African civil society groups³¹.

So embedded were the individuals from institutions funded by the BMGF in the official negotiations that even certain people serving as official government delegates were found to have been paid or employed by Target Malaria. On the sidelines lobbyists from other Gates funded outfits, such as The Cornell Alliance for Science also railed against the moratorium proposal³².

From bankrolling the technology development and creating the underlying tools, to shaping the narrative, picking the policy negotiators and even paying the

lobbyists, Bill Gates and his Foundation have so far been tightly interwoven into every part of the story of gene drive extinction technology. However, although the Foundation has been highly successful in influencing the technology's future deployment, they have not been able to suppress the global movements which have sprung up in resistance to gene drive technology. And just as health activists and food sovereignty activists have pushed back against the white saviour complex of philanthro-capitalists, so movements in West Africa have been quick to point out the racism and injustice of Gates-backed groups such as Target Malaria, who are using African people and ecosystems as experimental subjects for gene drive technology. In June 2018, over 1,000 farmers and activists protested against gene drive technology in the streets of Ouagadougou. Many are concerned about the eventual agricultural applications of gene drives and in the case of malaria, they believe that indigenous medicine and existing methods are better suited to fight the disease, particularly given the increasing number of countries which have completely eradicated it³³. In the words of food sovereignty activist Ali Tapsoba, with the organization Terre à Vie, "The best way to fight against malaria remains to put in place a good sanitation policy for our habitats and our environment. It is out of the question for us to let these scientists continue to conduct dangerous experiments outside their laboratories." It is perhaps at its intended point of experimentation, in Burkina Faso, that the Gates machinery will finally be forced to grind to a halt.

SCIENTIFIC TERRORISM IN BURKINA FASO

Tapsoba Ali de Goamma

After the failed adventure of genetically modified cotton¹, a future programmed drama is underway in Burkina Faso. Indeed, under the fallacious pretext of helping to fight malaria, Burkina has become an open-air laboratory where populations are used as guinea pigs by the hazardous experience: we are talking about the genetic manipulation of mosquitoes under the leadership of the Target Malaria Project².

Genetically modified mosquito eggs were imported from the Imperial College of London to Burkina Faso in November 2016. The Burkina Faso Institute for Health Science Research (IRSS) is the project leader in Burkina³.

This s project is a concentration of lies:

1-Problem of informed population consent.

In the work with the populations of the Bana and Souroukoudingan villages, the Target Malaria project used the fight against malaria as an argument to convince these populations to accept the experimental release in their villages of GM mosquitoes resulting from classical transgenesis (GM non- gene drive organism (GDO) mosquitoes) in 2019 (phase 1 of the project). There was no real free and informed consent but rather an abuse of the ignorance and illiteracy of local communities, the term GMO was never mentioned, nor explained.

2-Absence of clear experimental conception

According to the Target Malaria Project, "The purpose of the small-scale release is to collect scientific data on the longevity and dispersal of released mosquitoes, and it will serve also to strengthen the capacities and operational experience of our teams"⁴. The first release took place in July 2019; 6400 GM mosquitoes were released into the wild⁵. Up until now, no impact study of this release, and no risk assessment has been made, creating a situation which is contrary to the elementary ethics of medical experimentation.

3- Absence of correct population information

The TM project expects three phases of the project. The first two concern the releases of classical type GMO mosquitoes resulting from transgenesis (a genetic manipulation based on the transfer of genes between the very different species that do not normally cross in nature) and the third - the releases of GDO mosquitoes or GMOs resulting from a gene drive.

This third phase is scheduled for 2024, but the local communities know nothing about the health and ecological hazards of what will happen, they know nothing about the real nature of the experimentation that will take place in their villages.

Uncertain Project Impact

Gene drive is a new technology that causes the extermination of the entire species and it is this operation of extermination which is aimed at the *Anopheles gambiae* species which, according to Target Malaria, must be enabled to eliminate malaria. The populations are neither informed of the third phase of the project, nor of the technology of species extermination that will be used. Moreover, the *Anopheles gambiae* is not the only mosquito species that transmits malaria in Burkina Faso⁶, there are others, such as *Anopheles arabiensis* and *Anopheles funestus*. The impact of the removal of one among several mosquito species is uncertain.

March against Target Malaria, Burkina Faso, 2019

Ethical violations

Target Malaria offers the inhabitants of the villages a small income under conditions qualified as the basic ethical violation - be paid for accepting to be bitten by mosquitoes is an absence of respect for indigenous people, which is contrary to the Declaration of Helsinki of the World Medical Association which governs medical research.

Since the announcement of the Target Malaria project, the civil society has mobilized to say NO to this dangerous project and is determined to remove it from Burkina Faso, as they had already done with Monsanto⁷.

GLOBAL RESISTANCE TO GENETIC EXTINCTION TECHNOLOGY

Besides constantly exposing the dangers of releasing the untested technology of Gene Editing and Gene Drives in the environment, as well as the lack of transparency in the decision process¹, independent scientists, indigenous peoples, and civil society movements across the world have constantly been carrying out actions of resistance.

In December 2016, over 160 civil society organisations from six continents called for a “Moratorium on New Genetic Extinction Technology” at the 2016 UN Convention on Biological Diversity (CBD) in Cancun, Mexico². This moratorium call included both lab research and field trials, because of the potentially devastating effects that synthetic biology can have on entire ecosystems³.

Even though the moratorium found support among some countries, the final agreement merely urged caution in field-testing the products of synthetic biology, including gene drives, while supporting better risk-assessment of the products' potential effects⁴.

There has been no lack of attempts by the industry, through a Gates-funded lobby firm, to manipulate the UN decision-making process over gene drives, as emerged from a set of documents, released in December 2017, revealing how external actors with interest in the development of gene drives coordinated among themselves to influence the work of the relevant UN expert group⁵.

In July 2018, The European Court of Justice ruled that organisms obtained by mutagenesis plant breeding techniques are GMOs and should fall under the GMO Directive⁶.

The court ruling was seen as a victory for environmentalists while the agrifood industry and farmers organisations started a lobbying campaign to roll-back the ECJ ruling in favor of a new EU legislation⁷.

Independent scientists publicly demanded precaution⁸, stating that gene-edited products must be strictly regulated with full recognition of the uncertainties of the gene-

editing process – and that they must be labelled to enable farmer and consumer choice⁹.

In October 2018, in view of the 2018 CBD Conference of the Parties (COP), a broad alliance of indigenous peoples and civil society organizations published a “Call to Protect Food Systems from Genetic Extinction Technology”¹⁰. All the while, a coalition of European movements called upon the European Commission to support an international moratorium on the release of organisms modified by gene drive technology into the environment¹¹.

The global decision passed at the 2018 CBD COP, did not issue any moratorium, but set further barriers to the release of gene drives, by reinforcing as a priority the need to seek free, prior and informed consent or approval from all potentially impacted communities and Indigenous Peoples before even considering environmental release of gene drive organisms¹².

Along the same lines, in 2020, a similar coalition of European movements has requested that the EU Commission fully supports the EU Parliament's call for a global moratorium on the release of Gene Drive Organisms, in view of the EU preparation for the upcoming Conference of the Parties (COP15) to the Convention on Biological Diversity (CBD) and the Cartagena Protocol on Biosafety (COP-MOP10)¹³.

In the UK, Beyond GM, GM Freeze and GM Watch started a mobilization campaign¹⁴ in July 2020, in response to a proposed amendment¹⁵ to the Agriculture Bill, that would give the Secretary of State for the Environment, Food and Rural Affairs (currently George Eustice) the power to change the definition of a genetically modified organism (GMO) and re-classify many forms of genome editing as non-GM. Meaning that gene-editing / genetic modification techniques would no longer be regulated and could be used on farms and in food without public knowledge or consent.

In its last meeting before the summer recess, the House of Lords finally withdrew the amendment but only after the government renewed its commitment to push, promote and facilitate the wide use of genome editing in the future of UK farming and food¹⁶.

GATES FOUNDATION HIRED PR FIRM TO MANIPULATE UN OVER GENE DRIVES

Jonathan Latham

Originally Published December 4, 2017 at Independent Science News¹

The Bill and Melinda Gates Foundation this year paid a PR firm called Emerging Ag² \$1.6 million to recruit a covert coalition of academics to manipulate a UN decision-making process over gene drives, according to emails obtained through Freedom of Information requests.

Gene drives are a highly controversial new genetic extinction technology. They have been proposed as potentially able to eradicate malarial mosquitoes, agricultural pests, invasive species, as well as having potential military uses³.

Emerging Ag calls itself "a boutique international consulting firm providing communications and public affairs services." Its president and founder is Robynne Anderson, a former international communications director of CropLife, the global lobby group for the biotechnology, seed, and pesticide industries⁴.

The FOIA emails reveal that the project coordinated by Emerging Ag was dubbed the "Gene Drive Research Sponsors and Supporters coalition"⁵. It consisted of three members of a UN committee called the Ad Hoc Technical Expert Group on Synthetic Biology (AHTEG) plus a larger group of 65 covertly recruited, but seemingly independent, scientists and officials, all coordinated by a still larger number of government officials (mainly from English-speaking countries), PR advisors, academics, and members of various Gates-funded projects.

The AHTEG on Synthetic Biology is part of the UN Convention on Biological Diversity (CBD). This AHTEG is tasked with creating a formal set of regulatory recommendations to help governments avoid negative impacts on biodiversity. Its recommendations are supposed to draw from the discussions of an online forum of experts called The UN CBD Online Forum on Synthetic Biology.

The three AHTEG members who coordinated with Emerging Ag are Dr. Todd Kuiken of North Carolina State University, Robert Friedman of the J Craig Venter Institute⁶, and Professor Paul Freemont of Imperial College, London. The first and last represent teams and institutions that have received at least \$99 million dollars between them from the U.S. military and U.S. foundations, including Gates, to develop and test gene drive systems.

The CBD online forum on synthetic biology

According to the emails⁷, which were obtained from the University of North Carolina by Edward Hammond of Prickly Research⁸, the Gates funding for Emerging Ag was obtained to co-ordinate a “fight back against gene drive moratorium proponents.”

Funding for Emerging Ag first began after the last full meeting of the UN Convention on Biological Diversity, held in Cancún, Mexico in December 2016 which witnessed calls from Southern countries and over 170 international organizations for a UN moratorium on gene drives⁹. Adding to the pressure was a letter titled, “A Call for Conservation with a Conscience: No Place for Gene Drives in Conservation,” signed by 30 environmental leaders, including Jane Goodall. The letter asked for a “halt to all proposals for the use of gene drive technologies, but especially in conservation.”¹⁰

A primary function of Emerging Ag was to recruit academics. The primary task of the covertly recruited academics (those who were not on the inner circle of the AHTEG itself) was thus to stack the UN’s CBD Online Forum on Synthetic Biology. This forum was expected to discuss the wide scientific concerns about gene drives¹¹. The UN CBD process is the only multilateral process currently addressing gene drives.

Recruited academics received daily briefings and instructions from Emerging Ag on how to influence the discussion:

“My name is Ben Robinson, I work with Isabelle Coche & Delphine Thizy, and I will be sending you regular updates on the discussions taking place in the context of the CBD’s Open-Ended Online Forum on synthetic biology. I will monitor contributions and provide you with brief summaries of the content and tenor of conversations, while highlighting topics and posts you may wish to address. Should you feel that a topic needs to be addressed but you do not have the relevant resources or expertise, I can also help identify and coordinate those best suited among the group to respond to particular issues.”

The key role of the Gates Foundation

Delphine Thizy¹², cited in the email above, works at Target Malaria in London, England. Target Malaria is a Gates-funded project to use gene drives against mosquitoes¹³.

Emerging Ag's activities were overseen by Jeff Chertack who is Senior Program Officer of Global Policy and Advocacy at the Bill and Melinda Gates Foundation. He is a former public affairs executive from Ogilvy PR who previously represented biotech and pharma giants in Brussels. Chertack sat on the co-ordination team of Emerging Ag's "Gene Drive Research Sponsors and Supporters coalition"¹⁴ and is copied on several strategy calls and co-ordination phone calls¹⁵.

This is also not the first time that the Gates Foundation has used academics to influence public and private opinion on genetic engineering technologies, as witnessed by its funding of the Cornell Alliance for Science¹⁶.

Public Research and Regulation Initiative

The FOIA emails reveal that Emerging Ag also collaborated with a lobby group called the Public Research and Regulation Initiative (PRRI)¹⁷ that is little known outside the Convention on Biological Diversity.

PRRI has a related influence operation which predates the efforts of Emerging Ag. Its history of lobbying the UN Convention on Biological Diversity over GMOs is mentioned in emails sent to a Canadian official on the UN AHTEG¹⁸. In them, a PRRI member, Piet Vander Meer¹⁹, boasts about its 24/7 "backup operation" for "like-minded" government and industry experts who sit on the AHTEG.

The emails suggest that national government representatives of Canada, U.S., UK, Brazil and the Netherlands were being remotely assisted by PRRI during closed door discussions. To help PRRI the 'Gene Drive Research Sponsors and Supporters coalition' offered to approach US Department of Agriculture (USDA) contacts to find additional funding for PRRI's activities. The current funding sources of PRRI are not known but former funders include CropLife International, Monsanto and the US Grains Council²⁰.

BIODIVERSITY, GMOS, & GENE DRIVES OF THE MILITARISED MIND

Vandana Shiva

Originally published in *Seed Freedom*¹, July 7, 2016

A 2016 report from the National Academy of Science of The United States, titled “Gene Drives on the Horizon: Advancing Science, Navigating Uncertainty, and Aligning Research with Public Values”² warns: “One possible goal of release of a gene-drive modified organism is to cause the extinction of the target species or a drastic reduction in its abundance.”

Gene Drives have been called “mutagenic chain reactions” and are to the biological world what chain reactions are to the nuclear world. The Guardian describes Gene Drives as the “gene bomb”³.

Kevin Esvelt of MIT exclaims “a release anywhere is likely to be a release everywhere”, and asks “Do you really have the right to run an experiment where if you screw up, it affects the whole world?”⁴

The NAS report cites the case of wiping out amaranth as an example of “potential benefit”.

The Problem

*“Palmer amaranth infests agricultural fields throughout the American South. It has evolved resistance to the herbicide glyphosate, the world’s most-used herbicide (Powles, 2008), and this resistance has become geographically widespread.”*⁵

Industrial agriculture – promoted by the United States Foreign Policy – treats amaranth greens as “weeds”, and first tried to exterminate them with herbicides. Then came Monsanto, with Roundup Ready crops, genetically engineered to resist the spraying of Roundup so that the GMO crop would survive the otherwise lethal chemical, while everything else that was green perished. But not Palmer Amaranth, the superweed.

A quick fix involving potential irreparable damage

Instead of seeing the emergence of Palmer Amaranth as a superweed, as a result of the failure of the misguided approach of herbicide resistant GMOs, Monsanto & Co – which includes investors, scientists, corporations, DARPA, and Gates – are now rushing to drive the Amaranth species to extinction through the deployment of an untested tool. The tool of gene editing and gene drives.

A “DARPA-Mind” report casually states potential harm:

*“Gene drives developed for agricultural purposes could also have adverse effects on human well-being. Transfer of a suppression drive to a non-target wild species could have both adverse environmental outcomes and harmful effects on vegetable crops, for example. Palmer amaranth in Case Study 6 is a damaging weed in the United States, but related Amaranthus species are cultivated for food in Mexico, South America, India, and China.”*⁶

A scientific assessment would tell us that plants evolve resistance to herbicides which are supposed to kill them because they have intelligence, they evolve, and simply by the law of natural selection, they develop resistance. Denial of the intelligence in life, and denial of evolution is unscientific.

Amaranth is a web of life in itself

Amaranth's root, the word amara – meaning 'eternal' and 'deathless' in both Greek and Sanskrit – connects two formidable Houses of the ancient world. From the high slopes of the Himalayas, through the plains of north, central and south India, to the coastlines of the east, west and the south, Amaranth is a web of life in itself. Numerous varieties are found throughout the country. In fact, the Himalayan region is one of the 'centres of diversity' for the Amaranth.

Amaranth, amaranto, love-lies-bleeding, tassel flower, Joseph's coat, or ramdana (god's own grain) is the grain of well-being. It is rich in names, nutrition, history and meaning. There are records of Amaranth cultivation in South and Meso America as far back as 5,000 B.C. The sacred Amaranth

criss-crosses the Ancient World, nourishing cultures from the Andes to the Himalayas. Amaranth is a sacred grain for the Indian Civilisation as much as it is for the Aztec Civilisation, civilisations in the shadow of time, yet very much alive.

⁶ Committee on Gene Drive Research in Non-Human Organisms: Recommendations for Responsible Conduct; Board on Life Sciences; Division on Earth and Life Studies; National Academies of Sciences, Engineering, and Medicine. Gene Drives on the Horizon: Advancing Science, Navigating Uncertainty, and Aligning Research with Public Values. Washington (DC): National Academies Press (US); 2016 Jul 28. 4, Charting Human Values. Available from: <https://www.ncbi.nlm.nih.gov/books/NBK379278/>

The leaves of the amaranth contain more iron than spinach, and have a much more delicate taste. Besides rice bran, the grain of the amaranth has the highest content of iron amongst cereals. 1 kilogram of Amaranth flour, added to 1 kilogram of refined wheat flour, increases its iron content from 25 milligrams to 245 milligrams. Adding amaranth flour to wheat/rice flour is a cheaper and healthier way to prevent nutritional anaemia; rather than buying expensive tablets, tonics, health drinks, branded or bio fortified flour.

The Amaranth is extremely rich in complex carbohydrates and in proteins.⁷ It has 12–18% more protein than other cereals, particularly lysine – a critical amino acid.⁸ It also differs from other cereals in that 65% is found in the germ and 35% in the endosperm, as compared to an average of 15% in the germ and 85% in the endosperm for other cereals. When Amaranth flour is mixed 30:70 with either rice flour or wheat flour, protein quality rises, from 72 to 90, and 32 to 52, respectively. The Amaranth grain is about the richest source of calcium, other than milk. It has 390 grams of calcium compared to 10 grams in rice, and 23 grams in refined flour.⁹

The diversity of Amaranth greens is incredible, edibles that grow uncultivated in our fields. They are a major source of nutrition. Per 100 grams, Amaranth greens can give us 5.9 grams of protein, 530 milligrams of calcium, 83 milligrams of phosphorus, 38.5 milligrams of iron, 14,190 micrograms of carotene, 68 micrograms of Vitamin-C, 122 milligrams of magnesium.^{10, 11, 12, 13}

Amaranth is a superior alternative as a carotene source to GMO Golden Rice – which is being promoted as a future miracle for addressing Vitamin A deficiency. The poorest, landless woman and her children have access to nutrition through the generous gift of the Amaranth plant.

Conclusions

The paradigm of genetic engineering is based on genetic determinism and genetic reductionism. It is based on a denial of the self-organised, evolutionary potential of living organisms. It treats living organisms as a play lego set. But it is not, life is complex, self-organised, dynamic evolution – autopoietic.

The right to food and nutrition of the people outside the US, and the right of amaranth to continue to grow and evolve and nourish people, can be extinguished by powerful men in the US because they messed up their agriculture with Roundup Ready crops. And now want to mess up the planet, its biodiversity, and food and agriculture systems of the world with the tool of gene drives to push species to extinction.

As in the case of GMOs, the rush for Gene Drives, and CRISPR-based gene editing are linked to patents. And Bill Gates is financing the research that is leading to these patents. He with other billionaires has invested \$120 million in a company EDITAS to promote these technologies¹⁴. Bayer, the new face of Monsanto & Co, has invested \$35 million in the new GMO technologies, and committed over \$300 million over the next 5 years¹⁵.

“Biofortification” has been given the world food prize of 2016, yet biofortification is inferior to the nutrition provided by biodiversity and indigenous knowledge. The same forces promoting biofortification are also promoting the extermination of nutritious crops like amaranth, as well as rich indigenous cultures of food.

The project of deliberately exterminating species is a crime against nature and humanity. We are members of an Earth Family. Every species, every race is a member of one Earth Community. We cannot allow some members of our Earth Family to allocate to themselves the power and hubris to decide who will live, and who will be exterminated. The DARPA-Mind is obsolete.

GAIA SPEAKS...

I am Gaia,

I am Bhoomi, I am Pachamama, the Living Earth

For over 4 billion years I have generated trillions of species, microbes, plants, animals that mutually support each other working through my patterns of interrelatedness and peace to foster life on Earth. When climate systems and temperatures gave rise to the evolution of humans on Earth some 200,000 years ago, human species began to evolve and thrive, co-creating in diversity, freedom and reciprocity. My being is interconnectedness and harmony by which all life on Earth has evolved.

My expression is diversity.

Humanity has survived and sustained herself down the ages by caring for the Earth, maintaining her cycles of food and water, life and energy, while providing for people's needs. Living within planetary and ecological laws and boundaries is a precondition for humans to survive the unprecedented crises they face today for the future of humanity.

For millennia indigenous cultures and Earth citizens know me as Mother Earth, Terra Madre, connected in body and spirit, and know themselves my custodians, custodians of the Earth, their habitat, living according to established laws as an Earth Community, Earth Family . Not masters, controllers or owners.

Some 500 years ago the notion of my inseparability and interconnectedness with humans began to fade in people's minds and the illusion of being separate and disconnected from the Earth took hold.

With colonization and "civilising missions" those who saw themselves as superior and masters of the Earth, blind to the vital, self-organizing life on Earth and to the people who have lived and cared for the Earth from generation to generation, declared lands to be empty, devoid of life, dead earth. Terra Madre became seen as Terra Nullius, with insignificant people living on barren land.

Humans soon began violating Earth's planetary and ecological boundaries, burning, extracting and plundering Earth's living resources, polluting the soils, the land, water and air, unaware that it was the path of self-destruction.

Stubborn illusions of superiority, mastery, and of being separate from Earth and her intelligent self-organizing living systems are at the root of the degradation and desertification of the Earth and of the human spirit.

Violence and injustice are their consequences, which lead to war.

Forests are burning, from the Arctic to the Amazon. Chronic diseases are spreading, and long-gone pandemics have returned, as an industrial poison-based agricultural system invades into forests and across vast agricultural lands, poisoning all life from the smallest microbe to plants, animals and people.

Indigenous peoples and concerned earth citizens are today fighting for their survival as never before as my habitats and biodiversity are being ravaged as a result of the relentless pursuit of profits, control and power by monster corporations and billionaires.

Rapacious systems of profit and power-hungry billionaires are anathema to my self-organizing, regenerative and life-sustaining systems.

You, Mr. Gates and your foundation, falsely portrayed as a caring philanthropist of the poor, sick and hungry, best exemplify these extractive and destructive systems:

> I grow diversity, you impose monocultures and uniformity.

> I self-organise, self-create, maintain, and renew in interconnectedness. Your mechanized competitive mind imposes high-tech brutal control.

I promote harmony and freedom. You spawn violence and impose monopolies.

> I create cycles of renewal through living organisms. You impose inert genetically modified commodities.

> Farmers seeds are the source of life, to be freely saved, bred, exchanged and sold to provide food that nourishes the body. You produce genetically modified seeds to be patented, sold and traded as commodities for profit.

> I generate biodiversity that supports all life on Earth. You destroy biodiversity through poisons and create vast swathes of toxic monocultures.

> Earth's ecological agriculture provides health and nutrition. Your industrial agriculture creates disease, hunger and malnutrition.

Your so-called 'humanitarian' projects are a way to justify your carving out new colonies to enlarge your control and empire over humanity's life-sustaining systems: seeds, agriculture, food, health and knowledge.

Whether you know it or not, you are creating an Empire of disease.

Through digital genomic patenting, you are thwarting the regulations which have evolved to protect my biodiversity and the rights of those who sustain me.

As a major backer of geoengineering, together with your massive investments in the coal and oil industry's mining and extraction for fossil fuel energy, you poison Earth's atmosphere, disrupt Earth's ecosystems, violate my boundaries and dangerously destabilize the climate. Channelling these vast sums, instead, to reduce carbon emissions to zero would be far more cost effective to stop the warming of the planet.

You also assume the right to mutate life through gene drive technology and CRISPR, a high risk and unpredictable new genetic extinction technology - which can lead to the deliberate modification of humans and living species.

Life is not a Microsoft machine, and cannot be cut and pasted. Nature's intelligence continues to evolve and fights back in unpredictable and unexpected ways as the world is witnessing today with the Covid19 virus pandemic.

Ethical and long-term implications for the future of humanity find no space in your narrow self-absorbed, power hungry mind with which you disrupt my life-sustaining systems and threaten the biodiversity of life that I have evolved over billions of years.

You are not just rupturing the fabric I have woven, with your colossal wealth and mechanistic mind you are blindly setting the course of humanity faster on the destructive path of ecological, social and economic breakdown in this crucial and epoch changing time for the future of humanity.

You are tearing apart the fabric of community and society that makes life liveable. You are bringing human society itself to the brink of annihilation by destroying the conditions that guarantee life and freedom to all citizens.

Empires have come and gone.

I call on all citizens to take energy and creativity from me, and rise to protect their communities, societies, their humanity and future from you and your cohorts mechanical, robotic, thoughtless, toxic urge to control everything that is living and free.

My laws are higher than the laws made by powerful men for their limitless greed and hubris. Following my laws and respecting my ecological boundaries, humanity can find its way to regeneration of hope, freedom and life in abundance.

Reclaim the Seeds I have given you. Reclaim the living food that nourishes us.

Reclaim your Life and Freedom, in unity and solidarity, in community and interconnectedness, through diversity self-organisation.

Draw from me the power to speak, act and live the truth of life in freedom compassion, love and oneness.

Co-create with me an age beyond Empires, an age of generosity and wellbeing, an age of Gaia.

International Commission on the Future of Food and Agriculture

The **International Commission on the Future of Food and Agriculture** was created in 2003 in Tuscany, Italy, as a result of an international meeting of leaders in the food and agriculture movement brought together by Claudio Martini, then President of the Regional Government of Tuscany and Dr Vandana Shiva, founder of Navdanya.

The Commission brings together leading activists, academics, scientists, politicians and farmers from North and South, committed to building more socially and ecologically sustainable food and agriculture systems and active in creative movements for the protection of biodiversity, local food production and consumption, food security, food safety and health, and the rights of consumers and small farmers.

It has published six far-reaching Manifestos on issues of critical importance to the future of the planet: Manifesto on The Future of Food, Manifesto on the Future of Seeds, Manifesto on Climate Change and the Future of Food Security, Manifesto on Future of Knowledge Systems: knowledge sovereignty for a healthy planet, Manifesto called Terra Viva: Our Soil, Our Commons, our Future and Manifesto on Food for Health. The Manifestos have been widely distributed at major international United Nations and Civil Society Conferences and Summits on food security, agriculture, and climate change.

Navdanya International

Navdanya International was created in Italy in 2011 to strengthen the global outreach of Navdanya, its mother organization in India founded by Dr. Vandana Shiva, in its mission to protect nature, Earth's biodiversity and defend farmers' rights to save, exchange and evolve seeds and to protect indigenous knowledge and culture.

Navdanya International launched its Global Seed Freedom Campaign in 2012 to bring to citizens' attention the crucial role of seed in defending food sovereignty and food safety, and help strengthen the movement to save and exchange seeds in response to the growing corporate hijacking of our seeds and our food. In the context of the deepening global seed emergency and food crisis, Navdanya International formed the Global Movement for Seed Freedom as a way of uniting the thousands of diverse groups and organisations saving seeds around the world, in resisting the criminalisation of seed saving and in promoting ecological agriculture. The Seed Freedom Movement has grown into a very strong and vibrant global community, which continues to expand through the mushrooming of thousands of local seed groups and networks throughout the world, through festivals, workshops, demonstrations and policy advocacy campaigns.

Navdanya International has been at the forefront of showing connections between multiple crises in the global debate in a holistic perspective, but also connecting movements and actions on the ground. Its international campaigns, convergences, assemblies and advocacy actions have been focused on exploring the context of our food systems and its connections with soil, climate resilience, biodiversity, equity and social justice, and its connection and effects on the health of people and of the planet, with the aim of adding strength to the global mobilization against the industrialization, poisoning and impoverishment of our nutrition and environment, to create change at a systems level.
