2018 Report Introduction

The 2018 Annual Report summarizes data contributed to CCMH during the 2017-2018 academic year, beginning July 1, 2017 and ending on June 30, 2018. De-identified data were contributed by 152 college and university counseling centers, describing 179,964 unique college students seeking mental health treatment, 3,723 clinicians, and over 1,384,712 appointments.

The following are critical to understand when reading this report:

1. **This report describes college students receiving mental health services, NOT the general college student population.**
2. **Year-to-year changes in the number of students in this report are unrelated to changes in counseling center utilization.** These changes are due to the number and type of centers contributing data from one year to the next.
3. This report **is not a survey**. The data summarized herein is gathered during routine clinical practice at participating counseling centers, de-identified, and then contributed to CCMH.
4. The number of clients will vary by question due to variations in clinical procedure and the utilization rate of standardized questions within centers.
5. Counseling centers are required to receive IRB (institutional review board) approval at their institution to participate in data contribution to CCMH. Although CCMH maintains membership of almost 550 institutional counseling centers, only a portion of these institutions proceed with the IRB process and contribute data.

2018 Report Highlights

The following are key findings and implications contained in this year's report:

REMINDERS FROM PRIOR REPORTS

1. **2015:** Between Fall 2009 and Spring 2015, counseling center utilization increased by an average of 30-40%, while enrollment increased by only 5%. Increase in demand is primarily characterized by a growing frequency of students with a lifetime prevalence of threat-to-self indicators. These same students utilized 20-30% more services than students without threat-to-self indicators.
2. **2016:** Between Fall 2010 and Spring 2016, counseling center resources devoted to "rapid access" services increased by 28% on average, whereas resources allocated to "routine treatment" decreased slightly by 7.6%.
3. **2017:** Treatment provided by counseling centers was shown to be effective in reducing mental health distress, comparable to findings from randomized clinical trials. While some students improve quickly with a few sessions of therapy, others need more extended services to achieve the same level of change. Rigid policies related to session limits derived from averages may prematurely terminate treatment for students who would have improved with more treatment.

2018 HIGHLIGHTS

Special Section: This year's report examined the impact of two counseling center policies on treatment outcomes:

1. **EMR Sharing Policy:** Levels of access to counseling center EMRs by health center staff (none, partial, or open) were not associated with significant differences in symptom reduction during treatment in counseling center clients.
2. **Clinical Model Policy:** Counseling centers that use a treatment model (e.g., students are assigned to a clinician when an opening exists) produced significantly more symptom reduction, provided a significantly greater dosage of treatment (appointments per student), and offered significantly shorter wait-times between appointments than counseling centers that utilized an absorption model.

Other Highlights:

1. As assessed by clinicians, anxiety and depression continue to be the most common concerns of students (Page 16) and the most common overall concerns (Page 17). As a top-most concern, anxiety did not increase in prevalence for the first time in four years whereas depression continued to increase (Page 13).
2. The self-reported lifetime prevalence rates of "threat-to-self" characteristics (non-suicidal self-injury, 27.8%; serious suicidal ideation, 35.8%; and suicide attempts, 10.3%) increased for the eighth year in a row among students receiving counseling services (Page 10). Importantly, only 8.2% of students seeking treatment report serious suicidality in the last month (Page 10), and clinicians report suicidality as a presenting concern for just under 10% of students (Page 16).
3. The rate of prior counseling (54.4%) has demonstrated an upward trend for the last three years (Page 10). Other treatment variables, including taken a medication and hospitalization for mental health concerns have remained relatively flat or unclear in terms of trends.

4. Average rates of student self-reported anxiety and depression continue to increase while other areas of self-reported distress remain flat or are decreasing (Page 12).
5. Clinicians are now completing a Case Closure form that offers a range of information regarding the nature of treatment termination and critical incidents that occur during treatment (Page 18).

Center Policies and Treatment Outcomes

BACKGROUND

Based on CCMH member and Advisory Board feedback, the suggestion was made to examine counseling center policies that might impact treatment outcomes and types of services provided to students. When these ideas were further explored by CCMH members and the Advisory Board, the following two policies emerged with the greatest interest:

1. Practices regarding the sharing of electronic medical records (EMRs) with health center staff.
2. The impact of clinical models used to manage entry into routine counseling services.

A survey was sent to all CCMH members that inquired about the policies of their center related to EMR sharing practices and the clinical model implemented for routine counseling services. In the following sections, the findings related to the impact of these two center policies on treatment outcome and service provision are reviewed.

EMR Sharing Policy

In order to examine the question of EMR “integration” raised by our members, CCMH focused specifically on the policy governing shared access to EMRs between counseling and health center staff.

Based on survey responses, counseling centers were grouped according to their EMR sharing practices (see Figure 1):

1. No EMR Integration: A counseling center that does not share an EMR with health services.
2. Partial EMR Integration: A counseling center that shares an EMR with health services, but access and information sharing is limited, partial, or unidirectional in nature.
3. Full EMR Integration: A counseling center that shares an EMR with the health services and there is full bi-directional access to counseling and health records across professionals.

In order to compare symptom change between EMR policy groups, we calculated the average level of symptom change by counseling center. This was achieved by comparing the first and last administration of the CCAPS-34 for clients who scored above the low cut (e.g., moderate or high distress) during their first CCAPS-34 administration. Average symptom change by centers were sorted by EMR policy and then averaged as a group according to their sharing practices. Centers were included in the study if they had first and last administrations for a sufficient number of clients who began treatment in the moderate or elevated range of distress.

Figure 1 – EMR Sharing Policy Frequencies

EMR SHARING POLICY: FINDINGS AND IMPLICATIONS

Examination of this question was completed using data from 171 different institutions representing 93,861 unique students. Results indicated that the level of access to the counseling center EMRs by health center staff (none, partial, or full integrated) was not associated with any significant changes in all CCAPS-34 subscales including Depression, Generalized Anxiety, Social Anxiety, Academic Distress, Eating Concerns, Hostility, Alcohol Use, and General Distress (see Figure 2). One important limitation of this study is variability in the frequency of CCAPS administration by individual counseling centers.

Findings from this study of 171 counseling centers indicate that the most common policy options governing EMR integration between counseling and health centers were not associated with significantly different mental health treatment outcomes, despite apparent visual differences. Practically speaking, these findings suggest that policy decisions related to EMR access/integration are unlikely to directly impact the effectiveness of mental health treatment provided in the counseling center. Rather, enhanced treatment outcomes are likely to be determined by other factors, such as access to effective treatment (see Page 8) or collaborative/coordinated care, both of which can, and do, exist in many models of counseling center administration and records access.

Figure 2 – CCAPS-34 Change by EMR Integration Policy

Impact of Clinical Models on Treatment Outcomes

Prior CCMH findings indicate that counseling centers are coping with rapidly increasing demand for services, particularly by students with threat to self characteristics, who utilize 20-30% more services than students without these characteristics (CCMH 2015 Annual Report). Consequently, counseling centers have diverted more resources to crisis and triage appointments rather than traditional individual counseling services (CCMH 2016 Annual Report).

In the current report, CCMH investigated whether treatment outcomes varied based on the clinical systems used to assign students to clinicians for routine counseling services. Historically, counseling centers utilized clinical models that provided students with a distinct period of treatment, typically in the form of weekly therapy. However, as demand has continued to rise, counseling centers have been under pressure to accommodate the needs of students in a more timely manner. In some counseling centers clinicians are expected to “absorb” new clients for routine care regardless of availability within their current caseload (i.e., absorption model). Consequently, follow-up sessions are likely to be scheduled weeks apart and clinicians actively seek to “shed” or terminate existing clients in order to accommodate new ones. Alternatively, other counseling centers utilize a system that holds incoming clients and assigns new cases to each clinician only when they have space available (i.e., treatment model). Contrary to an absorption model, a treatment model allows clinicians to be “full” and provide weekly appointments if needed. Both clinical models can be short-term in nature (e.g., 6 sessions or less).

CCMH was interested in the following questions regarding the impact of these two clinical systems (absorption and treatment) on clinical outcomes:

1. Are there differences in symptom change?
2. Are there differences in the average number of counseling appointments attended?
3. Are there differences in average number of days between counseling appointments?

In order to incorporate appointment level data in these analyses, only schools that contribute data to CCMH were included (see Figure 3).

Figure 3 – Frequency of Clinical Models

IMPACT OF CLINICAL MODELS ON TREATMENT OUTCOMES: FINDINGS AND IMPLICATIONS

- Centers that utilize a treatment model demonstrated significantly greater decreases on CCAPS-34 Subscales of Depression, Generalized Anxiety, Social Anxiety, and General Distress compared to centers that used an absorption model (see Figure 4). While there were differences in the symptom change on the CCAPS-34 Subscales of Academic Distress, Eating Concerns, Hostility, and Alcohol use, these differences were not statistically significant.
- Students who received services at centers utilizing a treatment model attended significantly more appointments on average than students who sought services at centers that used an absorption model (see Figure 5).
- Students who received counseling services at centers that used an absorption model waited significantly more days between counseling appointments than students at centers that utilized a treatment model (see Figure 6).

The findings from this study clearly highlight the dilemma faced by counseling centers when making clinical policy decisions. Years of constantly rising demand lead to longer and longer wait times and a growing pressure to “do something” so students can access services more quickly. In lieu of an infusion of staffing and resources, one can easily see how a center might adopt some version of an absorption model, increase clinician’s caseloads beyond traditionally acceptable levels, and dilute the dose of treatment provided to each student in order to accommodate the rising demand. While this response to systemic pressure makes intuitive sense and may provide a short-term solution to meet rising demand for services, one can easily see how this decision may also act as a slippery slope that will become increasingly difficult to recover from and could lead to a reduction in routine treatment if new resources are not forthcoming.

While counseling centers must constantly seek to strike a balance between the benefits of absorption and treatment models, our findings suggest that de-prioritizing treatment in favor of absorption may have significant negative consequences for students in need. Results indicate that absorption models produce less symptom reduction, provide a significantly reduced dosage of treatment (appointments per student), and offer longer waits between appointments compared to counseling centers that utilize a treatment model.

Moving forward, it will be important for institutions to respond to growing demand in an informed, intentional, and transparent manner such that counseling centers and the students they serve understand the type and level of services that are funded. While it is important to be responsive to students in need, it is equally important to provide effective treatment.

Mental Health Trends

As of this report, CCMH has generated eight annual data sets (2010-2011 through 2017-2018), making it possible to examine numerous years of trends among college students seeking mental health services. To examine trends across key mental health indicators, the following items from the Mental Health History section of the Standardized Data Set (SDS) were simplified to “Yes” or “No,” providing a proxy for the lifetime prevalence of each item. These items may have changed slightly over time; please refer to prior versions of the SDS for specifics.

Data Sets

The below table summarizes the amount of data contributed to CCMH over the past eight academic years. These numbers indicate the amount of data contributed to CCMH, and do not represent an increase in utilization of counseling center services, as the number merely reflects an increase in data that has been contributed by counseling centers.

Year	# of Institutions	# of Clients
2010-2011	97	82,611
2011-2012	120	97,012
2012-2013	132	95,109
2013-2014	140	101,027
2014-2015	139	100,736
2015-2016	139	150,483
2016-2017	147	161,014
2017-2018	152	179,964

Attended counseling for mental health concerns

Taken a medication for mental health concerns

Been hospitalized for mental health concerns

Purposely injured yourself without suicidal intent (e.g., cutting, hitting, burning, hair pulling, etc.)

Seriously considered attempting suicide

Seriously considered attempting suicide (last time = within the last month or sooner)

NOTE: New question in 2012

Made a suicide attempt

Considered seriously hurting another person

Intentionally caused serious injury to another person

Had unwanted sexual contact(s) or experience(s)

Experienced harassing, controlling, and/or abusive behavior from another person (e.g., friend, family member, partner, authority figure, etc.)

Experienced a traumatic event that caused you to feel intense fear, helplessness, or horror

Felt the need to reduce your alcohol or drug use

Others have expressed concern about your alcohol or drug use

Received treatment for alcohol or drug use

Engaged in binge drinking (within the last 2 weeks)

Used marijuana (within the last 2 weeks)

NOTE: New question in 2012

CCAPS Trends

The Counseling Center Assessment of Psychological Symptoms (CCAPS) is a multidimensional assessment and outcome-monitoring instrument used by CCMH counseling centers. The frequency and clinical timing of CCAPS administration varies by counseling center. Students respond to the items on a five-point Likert scale from 0 (not at all like me) to 4 (extremely like me). The following charts provide information regarding trends in student self-reported distress as indicated by the CCAPS subscales.

CCAPS-62 Trends: Average Subscale Scores (2010 to 2018)

CCAPS-34 Trends: Average Subscale Scores (2010 to 2018)

CLICC Trends

The Clinician Index of Client Concerns (CLICC) was designed to capture the presenting concerns of counseling center clients, as assessed by the clinician, at the point of intake or equivalent appointment. The CLICC includes 54 concerns and asks the clinician (a) to check all that apply and (b) to identify the “top concern” of those selected.

CLICC Trends (Check All That Apply): Percentage of Clients with Each Concern from 2013 to 2018

CLICC Trends (Top Concern): Percentage of Clients with Each Concern from 2013 to 2018

Counseling Center Resource Utilization by Students

Data from 2017-2018 were analyzed to determine how counseling center resources were distributed among students seeking services. The following points describe how counseling center appointments are utilized by 166,261 students across participating CCMH centers in 2017-2018:

- The most common number of appointments per client/per year is one (1).
- Clients averaged 5.61 total appointments with a range of 1-112 appointments.
- 20% of clients accounted for 56% of all appointments, averaging 15 appointments.
- 10% of clients accounted for 38% of all appointments, averaging 20 appointments.
- 5% of clients accounted for 24% of all appointments, averaging 25 appointments.
- 1% of clients accounted for 7% of all appointments, averaging 38 appointments.
- 10 clients utilized a total of 948 appointments.

Average Number of Attended Individual Sessions

A common question within counseling centers is: What is the average number of counseling sessions attended by clients? To examine this question, we reviewed the 2017-2018 appointment data for initial clinical evaluations and any individual counseling session:

1. Total number of attended appointments (initial and individual counseling only): 593,517
2. Total number of clients who attended appointments: 130,418
3. Average number of attended counseling sessions per client (593,517 divided by 130,418): 4.55

This analysis of appointment attendance data across 146 institutions and approximately 594,000 appointments indicates that clients attend slightly less than five sessions of individual counseling on average, which is similar to previous annual report findings.

Standardized Data Set (SDS)

The Standardized Data Set (SDS) is a set of standardized data materials used by counseling centers during routine clinical practice. In this section, we provide a closer analysis of selected forms from the SDS: the Clinician Index of Client Concerns (CLICC); the Case Closure Form; and client, provider, center, and institutional demographic information.

Clinician Index of Client Concerns (CLICC)

The CLICC was designed by CCMH to measure the most common presenting concerns of counseling center clients, as assessed by the clinician, at the point of intake or equivalent initial appointment. The resulting data allow individual centers and CCMH to easily report on the most common client concerns in a wide array of research initiatives. The CLICC includes 54 concerns and asks the clinician (a) to check all that apply and (b) to identify the “top concern” of those selected. This dual approach captures the complexity of each client while also highlighting the primary concern of each student. Starting in July 2017, the category of “anxiety” was expanded to include options for six specific sub-types of anxiety, including generalized, social, unspecified/other, and test anxiety, as well as panic attacks and specific phobias.

CLICC – “CHECK ALL THAT APPLY”

For each client, clinicians are asked to “check all that apply” from a list of 54 concerns (as one client can have many concurrent concerns). This graph illustrates the frequency of each concern across all clients during the 2017-2018 academic year, regardless of how many concerns a student had or what their top concern was (N= 69,596).

CLICC – “TOP-MOST CONCERN”

Clinicians are then asked to choose one primary concern (i.e., the top concern) per client. This graph illustrates the frequency of each concern as the primary concern for clients during the 2017-2018 academic year (N= 69,596).

Case Closure Form

Beginning in July 2017, components of the Critical Incident and the Termination forms were merged to create the Case Closure Form. This form captures a wide array of reasons (academic, clinical, and client factors) why services ended for a client, as well as significant events that might have occurred during the course of services. Clinicians are asked to complete this form following the end of their service provision with a client. Clinicians can “select all that apply” from a checklist of 20 reasons why services may have ended for a given client. Additionally, they indicate if any of the provided significant events occurred during treatment.

REASONS FOR CLOSURE OF CASE

The following graphs describe the frequency of the various reasons why services ended for students who received treatment. Included within these frequencies (percentages) are only students who received treatment and had a provider complete a Case Closure Form related to their case during the 2017-2018 academic year (N= 41,365). Of note, the top two most endorsed reasons for closure of a case were the timing of the academic term 41%, followed by, the client not returning for their last appointment 27%.

Academic Status Reasons

Clinical Factor Reasons

Client Factor Reasons

CASE EVENTS

This graph describes the frequency of significant events that occurred during a course of treatment. Included within these frequencies (percentages) are only those students who received treatment and had a provider complete a Case Closure Form related to their case during the 2017-2018 academic year (N= 36,923). The most common significant event to occur in treatment was the use of a psychiatric medication (16.4%). It is also noteworthy that 2.1% of clients engaged in self-injury, 6.8% experienced suicidal ideation that required a safety plan, and 1.3% of were referred to the hospital for suicidality during the course of treatment.

Clinical Events

Hospitalization Events

Client Deaths

Client Demographic Information

The SDS contains a number of “core” or required items and a larger number of optional items that are typically asked of students seeking services. Because counseling centers vary in the types of questions they ask, the total number of responses varies by question.

What is your gender identity?

	<i>n</i>	Percent
Female	80,605	64.0
Male	42,819	34.0
Transgender	846	0.7
Self-Identify	1,720	1.4

This question is from the Standardized Data Set Question #88

What was your sex at birth?

	Overall (%) <i>n</i> =18,896	Female (%) <i>n</i> =12,185	Male (%) <i>n</i> =6,222	Transgender (%) <i>n</i> =143	Self-Identify (%) <i>n</i> =346
Female	66.5	99.7	0.6	74.1	77.5

This question is from the Standardized Data Set Question #61

Provider Data

The Standardized Data Set includes some basic demographic information about providers (clinicians) at participating counseling centers. The 2017-2018 data set represents 3,723 unique providers. Answer totals may vary by question since some counseling centers do not gather this data on providers or a provider may choose not to answer one or more questions.

Gender

	<i>n</i>	Percent
Male	434	26.2
Female	1,194	72.0
Transgender	13	0.8
Prefer not to answer	18	1.1

Age

<i>n</i>	Mean	Mode
1,490	40.1	31

Race/Ethnicity

	<i>n</i>	Percent
African-American/Black	144	8.8
American Indian or Alaskan Native	5	0.3

Psychiatric resident	6	0.4

Center Information

The information below describes the 152 colleges and universities that contributed data to the 2017-2018 CCMH data set.

Does your counseling center currently have an APA accredited pre-doctoral training program?

	<i>n</i>	Percent
Yes	55	36.7
No	95	63.3

Does your center have an annual individual psychotherapy limit?

	<i>n</i>	Percent
Yes	55	36.7
No	95	63.3

Is your counseling center currently accredited by IACS (International Association of Counseling Services)?

	<i>n</i>	Percent
Yes	71	47.3
No	79	52.7

If you answered "yes" to session limit, please enter your individual psychotherapy session limit.

	<i>n</i>	Percent
0	2	3.6
3	1	1.8
7	1	1.8
8	2	3.6
9	1	1.8
10	8	14.5
12	26	47.3
14	2	3.6
15	5	9.1
16	2	3.6
18	1	1.8
20	2	3.6
24	1	1.8

Which services are integrated with your counseling center? (check all that apply)

	<i>n</i>	Percent
Career services	11	7.3
Disability services	5	3.3
Drug and alcohol treatment program	40	26.7
Employee assistance program	2	1.3
Learning services	4	2.7
Health services	16	10.7
Testing services	21	14.0
Other	17	11.3

Check each service for which you charge a standard fee. (Don't check services that are initially free—e.g., first eight sessions.)

	<i>n</i>	Percent
Psychiatric evaluation (initial meeting)	25	16.7
Psychiatric follow-up (ongoing client)	25	16.7
Other	20	13.3
Formal assessment: Psychological	17	11.3
Formal assessment: Career	12	8.0
Formal assessment: Disability	9	6.0
Individual counseling	8	5.3
Group counseling	6	4.0
Intake	2	1.3

What psychiatric services are provided by your center?

	<i>n</i>	Percent
None	51	34.5
Part time, in house	50	33.8
Full time, in house	26	17.6
Part time, off-campus consultant	12	8.1
Other	9	6.1

Institutional Data

Data for the 2017-2018 CCMH data set were contributed by 152 colleges and universities that hold membership with CCMH. Demographics for these institutions are listed below.

	<i>n</i>	Percent
Type of Institution		
Private	55	36.4
Public	93	61.6
Combined	3	2.0
Location of Campus		
Midwest (IA, IL, IN, MI, MN, MT, ND, OH, WI)	38	25.2
Northeast (CT, DE, MA, MD, ME, NJ, NY, PA, VA, VT)	44	29.1
South (AL, AR, FL, GA, KY, MO, MS, NC, NV, OK, SC, TN, TX)	53	35.1
West (CA, CO, ID, OR, UT, WA)	16	10.6
Enrollment		
Under 1,500	4	3.1
1,501-2,500	13	10.0
2,501-5,000	13	10.0
5,001-7,500	11	8.5
7,501-10,000	11	8.5
10,001-15,000	19	14.6
15,001-20,000	14	10.8
20,001-25,000	15	11.5
