

Supplementary Figure 4

p50 overexpression results in a change in morphology of Q74 aggregates.

p50 overexpression results in a change in morphology of Q74 aggregates.

Immunocytochemistry of COS-7 cells co-transfected for 48 h with HA-Q74 (red) and pEGFP or p50 (green). Panels on left are magnifications of boxes on second panels. Boxes are same size. Examples of fragmented nuclei in p50-overexpressing cells (top panel) and nuclei in cells overexpressing p50 but treated with Z-VAD-fmk (a broad spectrum caspase inhibitor) (bottom two panels), are shown.
