Abbreviations: LD, linkage disequilibrium; SNP, single nucleotide polymorphism; MAF, minor allele frequency.

^a Within each gene, * (or ^) indicates SNPs in high LD with each other ($r^2 > 95\%$).

^b *VDR* restriction fragment length polymorphisms: rs731236 (taq1), rs7975232 (apa1), rs1544410 (bsm1), rs2228570 (fok1), rs11568820 (cdx2).

^c SNPs in parentheses are not included in Table 2 due to high LD ($r^2 > 95\%$).

^d Number of participants with genotype data available for analysis.

^e *DHCR7* SNPs (rs12785878 and rs3829251) are located within introns in the upstream *NADSYN1* gene.

^f SNP rs2228570 (fok1) leads to new start site 9 bp upstream and *VDR* protein longer by 3 amino acids.

Statistical Methods for Haplotype Analyses (see Supplement Table 2)

For haplotype analyses, linkage disequilibrium (LD) blocks were defined with Haploview using the standard algorithm (<https://www.broadinstitute.org>). Phased haplotype pairs and probabilities were estimated with PLINK using the standard EM algorithm (<http://pngu.mgh.harvard.edu>). The most common haplotype was used as the reference and was omitted from the regression models. Haplotype was modeled additively according to the number of non-referent variant haplotypes of each common type. Rare haplotypes (<1% frequency) were pooled. Wald test P values were calculated for individual haplotypes, and a likelihood ratio test used for the joint contribution of all haplotypes to the model.

Supplemental Table 2: Associations of Haplotypes with Baseline 25(OH)D Level and Modification of the Increase in 25(OH)D Level Due to Randomized Vitamin D₃ Supplementation (1,000 IU/day) for One Year

Haplotype	Baseline 25(OH)D			Year One Increase in 25(OH)D

Abbreviations: 25(OH)D, 25-hydroxyvitamin D; CI, confidence interval.

Bold numbers indicate $P \leq 0.05$.

^a Estimated % difference in baseline 25(OH)D level per haplotype compared to reference haplotype using linear regression of log-transformed 25(OH)D, adjusting for age, sex, and season of baseline blood draw.

^b Wald test P-values for individual haplotypes. Likelihood ratio test P-values for joint contribution of all haplotypes in a block (first row).

^c Estimated % difference in year one 25(OH)D level due to vitamin D₃ supplementation per haplotype compared to the reference haplotype using linear regression of log-transformed year one 25(OH)D, adjusting for log-transformed baseline 25(OH)D, age, sex, season of year one blood draw, haplotype and vitamin D₃ treatment assignment. Estimate is for the interaction between haplotype and vitamin D₃ treatment (haplotype*vitamin D₃ treatment) and indicates how haplotype modifies the effect of vitamin D₃ treatment on year one 25(OH)D level.

^d Wald test P-values for the interaction term (haplotype*vitamin D₃ treatment). Likelihood ratio test P-values for the joint contribution of all interaction terms for all haplotypes in the block (first row).
