Social Indicator Sample Survey-2018 [Multiple Indicator Cluster Survey]

SURVEY FINDINGS REPORT

June, 2019

Edited by:

A.Amarbal Director, Population and Social Statistical Department, NSO
R.Oidovdanzan Consultant, NSO

Prepared by:

S.Todgerel Survey team leader, Statistician, Population and social statistics department, NSO
T.Altantsetseg Survey team member, Statistician, Population and social statistics department, NSO
J.Munkhbadar National survey consultant, UNICEF
Sh.Sengum Survey team member, contractor, NSO
D.Mendbayar Survey team member, contractor, NSO
E.Zolzaya Survey team member, contractor, NSO

The Social Indicator Sample Survey was carried out in 2018 by National Statistical Office, as part of the Global MICS Programme. Technical support was provided by the United Nations Children's Fund (UNICEF), with government funding and financial support of UNICEF and United Nations Population Fund (UNFPA).

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments.

The objective of this report is to facilitate the timely dissemination and use of results from the SISS. The report contains detailed information on the survey methodology, and all standard MICS tables. The report is accompanied by Infographics of the main findings of the survey.

For more information on the Global MICS Programme, please go to mics.unicef.org.

SURVEY SAMPLE AND IMPLEMENTATION			
Sample frame	Administrative records of the household and population	Questionnaires	Household Women (age 15–49) Men (age 15–49) Children under five Children age 5–17 Water Quality Testing
Updated	December 2017		
Interviewer training	Aug–Sep 2018	Fieldwork	Sep–Dec 2018
Survey sample			
Households		Children under five	
– Sampled	14, 500	– Eligible	6, 269
– Occupied	14, 041	– Mothers/caretakers interviewed	6,091
– Interviewed	13, 798	– Response rate (Per cent)	97.2
– Response rate (Per cent)	98.3		
Women (age 15–49)		Children age 5–17	
– Eligible for interviews	11, 737	– Eligible	7, 628
– Interviewed	10, 794	– Mothers/caretakers interviewed	7, 427
– Response rate (Per cent)	92.0	– Response rate (Per cent)	97.4
Men (age 15–49)		Water Quality Testing	
– Eligible for interviews	5, 513	– Eligible	2, 900
– Interviewed	4, 477	– Completed	2, 736
– Response rate (Per cent)	81.2	– Completion rate (Per cent)	94.3
Survey population			
Average household size	3.0	Percentage of population living in	
Percentage of population under:		– Urban areas	67.5
– Age 5	12.7	– Rural areas	32.5
– Age 18	37.5	– Western	12.0
		– Khangai	17.7
Percentage of women age 15–49 years with at least one live birth in the last 2 years	20.3	– Central	15.6
		– Eastern	7.1
		– Ulaanbaatar	47.6

FOREWORD

As per the Law on Statistics of Mongolia, the National Statistics Office (NSO) of Mongolia has successfully conducted the Social Indicator Sample Survey (SISS) in 2018 with technical and financial support from the Government of Mongolia, United Nations Children's Fund (UNICEF) and United Nations Population Fund (UNFPA). The SISS, NSO employed the sixth round of Multiple Indicator Cluster Survey platform.

The SISS is designed to collect high quality data on the situation of children, women, men and households, including health, education, development, protection, wealth, human rights implementation of Mongolia, awareness of and attitude towards HIV/AIDS, sexual behaviour, household access to safely managed water and sanitation conditions, and salt iodisation.

The questionnaires and indicators of this new round of the survey have been updated to support the progress monitoring of the Sustainable Development Goals (SDGs). It introduces new modules on children's foundational learning skills and parental involvement, adult and child functioning, victimization for women and men, household water quality test for E-coli detection and household energy use. The survey interviewed 14,500 households nationwide.

The SISS results will provide the estimates at both national and regional levels. In addition, the results will be further broken down for six selected provinces (Bayan-Ulgii, Bayankhongor, Govi-Altai, Zavkhan, Umnugovi, Khuvsgul) and two districts (Bayanzurkh, Nalaikh) to better understand geographic disparities.

We expect the results of the SISS to be a valuable source of data for policymakers, government partners, international organizations, academia and many others to inform and develop policies and programmes to further improve the well-being of children, women and men. More than 178 indicators estimated as part of this survey can be used for monitoring the SDGs, the Convention on the Rights of the Child, the United Nations General Assembly Special Session on HIV/AIDS and the national programmes including "National Maternal, Child and Reproductive Health Programme", "National Programme on Child Development and Protection" and "National Nutrition Programme".

To ensure accessible and up-to-date data, the present survey findings report and the infographics are delivered to you in both Mongolian and English languages within 6 months after completion of data collection. The report includes more than 250 tables with comprehensive descriptions disaggregated by demographic, social, economic and geographic background characteristics of the population based on responses to approximately 870 questions developed in the questionnaires. This would facilitate monitoring of the SDGs principle "leaving no one behind".

We would like to express our sincere gratitude to the Steering Committee and Working Group for their invaluable contribution and collaboration throughout the process. Our special thanks go to the survey team, the data collection team supervisors and interviewers, UNICEF MICS teams at Regional Office and Headquarters, the National Statistical Office management, local statistical units and local administration offices for their assistance and cooperation. Finally, we thank the households interviewed for their time, patience and valuable information.

ARIUNZAYA.A

*Chairperson of NSO and Chair
of SISS Steering Committee*

ALEX HEIKENS

UNICEF Mongolia*

KAORI ISHIKAWA

*Head of Office
UNFPA Mongolia*

This report is based on 6th round of the Multiple Indicator Cluster Survey (MICS6), which Mongolia adopted and named as the Social Indicator Sample Survey (SISS). The National Statistical Office (NSO) of Mongolia conducted the SISS in 2018 in collaboration with United Nations Children's Fund (UNICEF) and United Nations Population Fund (UNFPA).

The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programmes, and for monitoring progress toward national goals and global commitments. It also produces data necessary for monitoring national policies and programmes Sustainable Development Vision of Mongolia 2030, The State Policy on Population Development, National Programme on Maternal, Child and Reproductive health, National Programme on Child Development and Protection and National Nutrition Programme.

A COMMITMENT TO ACTION: NATIONAL AND INTERNATIONAL REPORTING RESPONSIBILITIES

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

"Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children Indicators of human development should be periodically reviewed by national leaders and decision makers, as is currently done with indicators of economic development..."

The Multiple Indicator Cluster Surveys programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

"We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research" (A World Fit for Children, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

"... We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action."

The General Assembly Resolution, adopted on 25 September 2015, **"Transforming Our World: the 2030 Agenda for Sustainable Development"** stipulates that for the success of the universal SDG agenda,

"quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind" (paragraph 48); recognizes that "...baseline data for several of the targets remains unavailable..." and calls for "...strengthening data collection and capacity building in Member States..."

Legal basis for enforcement of children's rights was established for Mongolia with the adoption of the "Law on the Protection of the Rights of the Child" in 1996, which is based on the principles of United Nations Convention on the Rights of the Child (CRC). In 2016, the law was revised as "Law of Mongolia on Child Rights".

This was part of the recent efforts for achieving improved legal coordination surrounding the protection of children's rights with several new laws approved and implemented in the recent years, namely the "Childcare Service Law", "Law on Child Protection" in 2015, separation of crimes against children as an individual chapter in the 2015 revision of Criminal Code of Mongolia and addition of regulations concerning protection, provision of special protection for children from domestic violence in the 2016 revision of Law on Domestic Violence.

Mongolia has presented their 5th report on national implementation of the CRC during the 75th Session of the Committee on the Rights of the Child in May 2017 and has received proposals dedicated to center on the implementation of concerning legislations.

Despite the improvements to and associated positive results from legislations surrounding Children's right and protection, healthcare services and its sufficiency, there still are concerning problems that are to be attended.

The government of Mongolia implemented "National Programme of Action for the Development and Protection of Children" twice in 1992–2002 and 2002–2010 respectively and "Strategy for Strengthening Child Protection" from 2012 to 2015. Based on past experiences of various nationwide programmes, Mongolia is currently implementing the National Programme on Child Development and Protection for 2017–2021.

The goal of the programme, is to ensure safe environment for living, education, development of children with provided protection, rights to participation in social environments, and to strengthen the national system of child protection with support from accompanying institutions.

Following objectives will be carried out in order to achieve the goal:

1. Provide child-friendly environment with granted rights to safe and healthy environment.
2. Build an environment suitable for discovery and development of talent and skills of all children.

3. Cultivate mindset of listening to and respecting children's opinions in society, increase involvement of children in formulation, implementation and evaluation of policies.
4. Protect children from discrimination, pressure, violence, all forms of abuse and risks in all social environments.
5. Reduce child deprivation, including income and non-income poverty, by supporting welfare and social security for equality.

Law on Development Policy and Planning of Mongolia was adopted in November 2015 for the purpose of establishing a unified framework of development policy documentation for stages of planning, implementation, monitoring, evaluation, and determining standards, rights, duties and responsibilities of concerned parties. In February 2016, Sustainable Development Vision of Mongolia 2030 (SDV) has been approved with resolution of the parliament. Consequently, the National Committee for Sustainable Development was established under the Prime Minister of Mongolia in 2017 with the aim of implementing the SDGs and establishing the structural mechanism surrounding the implementation where the NSO is responsible for collecting, processing and disseminating data necessary for monitoring the SDGs.

The Social Indicator Sample Survey results are critically important for the purposes of SDG monitoring, as the survey produces information on 33 global SDG indicators and 10 SDG indicators adopted by SDG in Mongolia, either in their entirety or partially.

The Social Indicator Sample Survey–2018 has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in SISS, Mongolia.
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;
- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate data in for the assessment of progress in some social sectors;

- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

This report presents the results of the Social Indicator Sample Survey–2018. Following Chapter 2 on survey methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in “Indicators and definitions”. Prior to presenting the survey results, organized into thematic chapters, the coverage of the sample and the main characteristics of respondents is covered in Chapter 4, “Sample coverage and characteristics of respondents”. From Chapter 5, all survey results are presented in seven thematic chapters. In each chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations.

Chapter 5, “Survive”, includes findings on under–5 mortality. This is followed by Chapter 6, “Thrive – Reproductive and maternal health”, which presents findings on fertility, early childbearing, contraception, unmet need, antenatal care, delivery care, birthweight, and post–natal care, Sexually Transmitted Infections (STIs) and HIV/AIDS, male circumcision, cervical cancer screening for early detection¹, knowledge of Human Papilloma Virus¹ and ends with abortion¹.

The following chapter, “Thrive – Child health, nutrition and development” presents findings on immunisation, disease episodes, diarrhoea, household energy use, symptoms of acute respiratory infection, infant and young child feeding, malnutrition, salt iodisation, and early childhood development.

Learning is the topic of the next chapter, where survey findings on early childhood education, educational attendance, paternal involvement in children’s education, and foundational learning skills are covered.

The next chapter, “Protected from violence and exploitation”, includes survey results on birth registration, child discipline, child labour, child marriage, victimisation, feelings of safety, and attitudes toward domestic violence.

Chapter 10, “Live In a safe and clean environment”, covers the topics of drinking water, handwashing, sanitation, and menstrual hygiene.

The final thematic chapter is on equity – titled “Equitable chance in life”, the chapter presents findings on a range of equity related topics, including child functioning, discrimination and harassment, and subjective well–being.

The report ends with appendices, including some aggregate results for target provinces and districts, detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

¹ Additional country–specific modules indicated.

2.1 SAMPLE DESIGN

The Mongolia Social Indicator Sample Survey (SISS) is household based, and the last-stage sample units are individual households.

The sample for the SISS 2018 was designed to provide estimates for a large number of indicators on the situation of children and women and men at the national, urban and rural areas, five regions (Eastern, Western, Central, Khangai and Ulaanbaatar) and eight target provinces/districts (provinces of Bayan-Ulgii, Bayankhongor, Govi-Altai, Zavkhan, Umnugovi, Khuvsgul and districts of Bayanzurkh and Nalaikh).

The target provinces and districts were respectively selected by the request and funding of the United Nations Children's Fund where the organization's projects are being implemented, namely, Bayan-Ulgii, Zavkhan, Govi-Altai, Bayankhongor, Khuvsgul provinces, Bayanzurkh and Nalaikh districts, and by the request of United Nations Population Fund, with funding from "Oyu Tolgoi" LLC, Umnugovi province was targeted to examine the mining-based province's current situation.

A sample of 14,500 households were selected country-wide. The sample size (number of households) within each region was first determined by applying the square root allocation. The sample size was then adjusted for individual provinces and districts that are domains.

A two-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on the 2017 Population and Household Registry (PHR). The primary sampling units (PSUs) selected at the first stage were the enumeration areas (EAs) defined for this

survey. The EAs were selected systematically with probability proportional to size within each stratum, from the full list of EAs in the frame. After a household listing was carried out in the sampled EAs during the period of August – September 2018, a systematic sample of 25 households was selected from each PSU.

As the sample is not self-weighting, sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.2 QUESTIONNAIRES

The questionnaires were based on the MICS6 standard questionnaires¹ considering information necessities, and survey objectives, 7 questionnaires were used in the survey:

1. a household questionnaire to collect basic demographic information on all de jure household members (usual residents), the household, and the dwelling;
2. a water quality testing questionnaire (E coli) administered in 5 households in each cluster of the sample;
3. a questionnaire for individual women administered in each household to all women age 15–49 years;
4. a questionnaire for individual men administered in every second household to all men age 15–49 years;
5. an under-5 questionnaire, administered to mothers (or caretakers) of all children under 5 living in the household;

¹ The standard MICS6 questionnaires can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

6. a questionnaire form for vaccination records at health facility, for all children age 0–2 years with a completed under–5 questionnaire, was used to record vaccinations from the registers at health facilities; and
7. a questionnaire for children age 5–17 years, administered to the mother (or caretaker) of one randomly selected child age 5–17 years living in the household.²

From the MICS6 model English version, the questionnaires were customised and translated into Mongolian and new modules were discussed in various consultative meetings and questionnaires were discussed with technical working groups. Modifications and customizations were made in the tools based on technical working group recommendations and data needs.

The questionnaires included the following modules:

Household Questionnaire	Questionnaire for Individual Women / Men	Questionnaire for Children Age 5–17 Years
List of Household Members Education Household Characteristics Household Energy Use Water and Sanitation Handwashing Salt Iodisation	Woman's/Men's Background ^[M] Mass Media and ICT ^[M] Fertility ^[M] Birth History Pregnancy Outcome ^[spec] Desire for Last Birth Maternal and Newborn Health Post–natal Health Checks Contraception Unmet Need Marriage/Union ^[M] Attitudes Toward Domestic Violence ^[M] Victimization ^[M] Adult Functioning ^[M] Sexual Behaviour ^[M] HIV/AIDS, STIs Knowledge and Attitudes ^[M] Cervical Cancer ^[spec] Circumcision ^[only M] Tobacco and Alcohol Use ^[M] Life Satisfaction ^[M]	Child's Background Child Labour Child Discipline Child Functioning Parental Involvement Foundational Learning Skills
Water Quality Testing Questionnaire (E coli)		Questionnaire for Children Under 5
^[M] The individual Questionnaire for Men only included those modules. ^[spec] Additional country–specific modules.		Under–Five's Background Birth Registration Early Childhood Development Child Discipline Child Functioning Breastfeeding and Dietary Intake Immunisation Care of Illness Anthropometry
		Form for vaccination record at health facility

Following principles were established for modifying the questionnaires:

1. Ensure data comparability with preceding surveys
2. Ensure internationally comparable data
3. Consider country–specific factors, data gaps and data needs.

PAPI pre–testing was carried out in five locations, namely in Sukhbaatar soum, Khushaat soum in Selenge aimag, and in Nalaikh district of Ulaanbaatar during May 2018. Based on the results of the pre–test, modifications were made to the wording and coherence of the questions in questionnaires.

In addition to the administration of questionnaires, fieldwork teams tested the salt used for cooking in the households for iodine content, observed the place for handwashing, measured

the weights and heights of children age under 5 years, and tested household and source water for E. coli levels. Details and findings of these observations and measurements are

² Children age 15–17 years living without their mother and with no identified caretaker in the household were considered emancipated and the questionnaire for children age 5–17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour and Child Functioning modules is not reproduced in Appendix E.

provided in the respective sections of the report. Further, the questionnaire for children age 5–17 years included a reading and mathematics assessment administered to children age 7–14 years.

A copy of the SISS 2018 questionnaires is provided in Appendix E.

2.3 ETHICAL PROTOCOL

The survey plan was approved by order A/67 2018 of Chairperson of NSO in 2018. The plan included a Protection Protocol which outlines the potential risks during the life cycle of the survey and management strategies to mitigate these.

Verbal consent was obtained for each respondent participating and, for children age 15–17 years individually interviewed, adult consent was obtained in advance of the child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse answering all or particular questions, as well as to stop the interview at any time.

Salt testing results were directly presented to participating households, whereas water quality test results were shared only with the local administration.

2.4 DATA COLLECTION METHOD

MICS6 utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CSPro (Census and Survey Processing System) software, Version 6.3, including a MICS6 dedicated data management platform. Procedures and standard programs³ developed under the global MICS programme were adapted to the SISS 2018 final questionnaires and used throughout.

The CAPI application was tested in Kherlen, Bayan-Ovoo soums of Khentii aimag, and Baganuur district of Ulaanbaatar from 23rd July to 2nd August of 2018. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

2.5 TRAINING

Training for the fieldwork was conducted for 31 days from August 20th to September 19th, 2018. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on paper questionnaires for 20 days, followed by a 10-day training on the CAPI application.

The trainees spent 4 days in field practice in total with 2 days of paper-based questionnaire and 2 days of data collection using tablets. The training agenda was based on the standard MICS6 training agenda.⁴ Complementary trainings such as disaster/first-aid training, dog aggression and communication, and team psychology were added to the agenda in view of country-specific reasons.

Trainees received dedicated training on anthropometric measurements and water quality testing for a total of 4 days, including one day of field practice on each of the two tasks.

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

2.6 FIELDWORK

The data were collected by 19 teams; each was comprised of 5 interviewers (3 female and 2 male interviewers, male interviewers also operated as measurers⁵), 2 drivers and a supervisor. Fieldwork was conducted from September 21st in Ulaanbaatar and from October 3rd in local area until December 28th, 2018 lasting for 99 days.

Data was collected using tablet computers running the Windows 10 operating system, utilising a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

2.7 FIELDWORK QUALITY CONTROL MEASURES

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on

3 The standard MICS6 data collection application can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-processing>.

4 The template training agenda can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

5 The standard MICS6 guideline demonstrates an exclusive measurer role on all teams for anthropometric measurements and water quality tests.

2 households per cluster. Daily observations of interviewer skills and performance was conducted.

During the fieldwork period, each team was visited at least twice by either NSO survey management team members, UNICEF MICS Team and UNFPA members for the purpose of monitoring and advising on team organisation and fieldwork operations.

Throughout the fieldwork, field check tables (FCTs) were produced twice a week for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.⁶

2.8 DATA MANAGEMENT, EDITING AND ANALYSIS

Data were received at the NSO's data server via the transfer application⁷ on the supervisors' tablets. Data from interviewers are batched on the supervisors' application via Bluetooth transfer, which is also used by supervisors for checking for irregularities. Whenever logistically possible, synchronisation was done daily. The central office

communicated application updates to field teams through this system.

Following the completion of fieldwork, data were edited according to editing process described in detail in the standard MICS6 Guidelines for Secondary Editing.⁸

Data were analysed using the Statistical Package for Social Sciences (SPSS) software, Version 24.0. Model syntax and tabulation plan developed by UNICEF⁹ were used with customisation for additional country-specific analyses.

2.9 DATA SHARING

Unique identifiers such as location and names collected during interviews were removed from datasets to ensure privacy. These anonymised data files are made available on Official website of the NSO and on the MICS website¹⁰ and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

Information encompassing all activities during every stage of the survey is archived. Also a Metadata repository is created and is openly shared with public.

6 The standard field check tables can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-collection>.

7 Internet File Streaming System (IFSS) recommended in the MICS6 guidelines was not used in this survey

8 The standard guidelines can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-processing>.

9 The standard tabulation plan and syntax files can be found at: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#analysis>

10 The survey datasets can be found at: "Surveys." Home – UNICEF MICS. Accessed August 24, 2018. <http://mics.unicef.org/surveys>.

INDICATORS AND DEFINITIONS

SISS/MICS INDICATOR		SDG ¹	Module ²	Definition ³	Value
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS					
SR.1	Access to electricity	7.1.1	HC	Percentage of household members with access to electricity	98.1
SR.2	Literacy rate (age 15–24 years)		WB	Percentage of women and men age 15–24 years who are able to read a short simple statement about everyday life or who attended secondary or higher education	
				Women	99.3
				Men	97.6
SR.3	Exposure to mass media		MT	Percentage of women and men age 15–49 years who, at least once a week, read a newspaper or magazine, listen to the radio, and watch television	
				Women	4.5
				Men	7.5
SR.4	Households with a radio		HC	Percentage of households that have a radio	6.2
SR.5	Households with a television		HC	Percentage of households that have a television	92.6
SR.6	Households with a telephone		HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	98.9
SR.7	Households with a computer		HC	Percentage of households that have a computer	30.6
SR.8	Households with internet		HC	Percentage of households that have access to the internet by any device from home	36.1
SR.9	Use of computer		MT	Percentage of women and men age 15–49 years who used a computer during the last 3 months	
				Women	36.2
				Men	35.3

1 Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. SISS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by SISS. The latter cases are included here as long as the current international methodology allows for only the way that the SISS indicator is defined, and/or a significant part of the SDG indicator can be generated by the SISS/MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

2 Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

3 All SISS/MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

SISS/MICS INDICATOR		SDG ¹	Module ²	Definition ³	Value
SR.10	Ownership of mobile phone	5.b.1	MT	Percentage of women and men age 15–49 years who own a mobile phone Women Men	97.0 95.5
SR.11	Use of mobile phone		MT	Percentage of women and men age 15–49 years who used a mobile telephone during the last 3 months Women Men	97.2 94.5
SR.12a SR.12b	Use of internet	17.8.1	MT	Percentage of women and men age 15–49 years who used the internet Women (a) during the last 3 months (b) at least once a week during the last 3 months Men (a) during the last 3 months (b) at least once a week during the last 3 months	73.6 69.2 63.9 59.5
SR.13a SR.13b	ICT skills	4.4.1	MT	Percentage of women and men who have carried out at least one of nine specific computer related activities during the last 3 months Women (a) age 15–24 (b) age 15–49 Men (a) age 15–24 (b) age 15–49	42.9 31.6 44.9 29.7
SR.14a	Use of tobacco	3.a.1	TA	Percentage of women and men age 15–49 years who smoked cigarettes or used smoked or smokeless tobacco products at any time during the last one month Women Men	9.2 58.0
SR.14b	Non-smokers	3.8.1	TA	Percentage of women and men age 15–49 years who did not smoke cigarettes or any other smoked tobacco product during the last one month Women Men	90.8 43.5
SR.15	Smoking before age 15		TA	Percentage of women and men age 15–49 years who smoked a whole cigarette before age 15 Women Men	1.1 16.4
SR.16	Use of alcohol		TA	Percentage of women and men age 15–49 years who had at least one alcoholic drink at any time during the last one month Women Men	27.4 47.2
SR.17	Use of alcohol before age 15		TA	Percentage of women and men age 15–49 years who had at least one alcoholic drink before age 15 Women Men	0.7 3.1
SR.18	Children's living arrangements		HL	Percentage of children age 0–17 years living with neither biological parent	7.7

SISS/MICS INDICATOR		SDG ¹	Module ²	Definition ³	Value
SR.19	Prevalence of children with one or both parents dead		HL	Percentage of children age 0–17 years with one or both biological parents dead	6.0
SR.20	Children with at least one parent living abroad		HL	Percentage of children age 0–17 years with at least one biological parent living abroad	2.0

SURVIVE ⁴					
CS.1	Neonatal mortality rate	3.2.2	BH	Probability of dying within the first month of life	9
CS.2	Post–neonatal mortality rate		BH	Difference between infant and neonatal mortality rates	7
CS.3	Infant mortality rate		CM / BH	Probability of dying between birth and the first birthday	16
CS.4	Child mortality rate		BH	Probability of dying between the first and the fifth birthdays	4
CS.5	Under–five mortality rate	3.2.1	CM / BH	Probability of dying between birth and the fifth birthday	19

REPRODUCTIVE AND MATERNAL HEALTH					
TM.1	Adolescent birth rate	3.7.2	CM / BH	Age–specific fertility rate for women age 15–19 years	42.6
TM.2	Early childbearing		CM / BH	Percentage of women age 20–24 years who have had a live birth before age 18	4.2
TM.3	Contraceptive prevalence rate		CP	Percentage of women age 15–49 years currently married or in union who are using (or whose partner is using) a (modern or traditional) contraceptive method	48.1
TM.4	Need for family planning satisfied with modern contraception ⁵	3.7.1 & 3.8.1	UN	Percentage of women age 15–49 years currently married or in union who have their need for family planning satisfied with modern contraceptive methods	63.9
TM.S1	Women's own informed decisions regarding sexual relations, contraceptive use and reproductive health care (based on country specific definition)	5.6.1	DV	Percentage of women aged 15–49 years currently married/ in union and ever used contraception methods who make their own informed decisions regarding sexual relations, contraceptive use and reproductive health care	38.7
TM.5a TM.5b TM.S2 TM.5c	Antenatal care coverage	3.8.1	MN	Percentage of women age 15–49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth were attended (a) at least once by skilled health personnel (b) at least four times by any provider (c) at least six times by any provider (based on country specific definition) (d) at least eight times by any provider	99.1 88.5 72.4 47.0
TM.6	Content of antenatal care		MN	Percentage of women age 15–49 years with a live birth in the last 2 years who during the pregnancy of the most recent live birth, at least once, had blood pressure measured and gave urine and blood samples as part of antenatal care	96.4
TM.8	Institutional deliveries		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live birth was delivered in a health facility	98.4

⁴ Mortality indicators are calculated for the last 5–year period.

⁵ See Table TM.3.3 for a detailed description.

SISS/MICS INDICATOR		SDG ⁶	Module ⁷	Definition ⁸	Value
TM.9	Skilled attendant at delivery	3.1.2	MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live birth was attended by skilled health personnel	99.3
TM.10	Caesarean section		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live birth was delivered by caesarean section	26.2
TM.11	Children weighed at birth		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child was weighed at birth	99.3
TM.12	Post-partum stay in health facility		PN	Percentage of women age 15–49 years with a live birth in the last 2 years and delivered the most recent live birth in a health facility who stayed in the health facility for 12 hours or more after the delivery	98.1
TM.13	Post-natal health check for the newborn		PN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery	98.2
TM.14	Newborns dried		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child was dried after birth	79.6
TM.15	Skin-to-skin care		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child was placed on the mother's bare chest after birth	58.6
TM.S3	Skin-to-skin care (based on country specific definition)		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child was placed on the mother's bare chest and hat on after birth (Skin-to-skin care included newborn hat on)	41.5
TM.16	Delayed bathing		MN	Percentage of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child was first bathed more than 24 hours after birth	69.8
TM.19	Post-natal signal care functions ⁹		PN	Percentage of women age 15–49 years with a live birth in the last 2 years for whom the most recent live-born child received at least 2 post-natal signal care functions within 2 days of birth	93.8
TM.20	Post-natal health check for the mother		PN	Percentage of women age 15–49 years with a live birth in the last 2 years who received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery of their most recent live birth	94.1

6 Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. SISS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by SISS. The latter cases are included here as long as the current international methodology allows for only the way that the SISS indicator is defined, and/or a significant part of the SDG indicator can be generated by the SISS/MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

7 Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

8 All SISS/MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

9 Signal functions are 1) Checking the cord, 2) Counseling on danger signs, 3) Assessing temperature, 4) Observing/counseling on breastfeeding, and 5) Weighing the baby (where applicable).

SISS/MICS INDICATOR	SDG ¹⁰	Module ¹¹	Definition ¹²	Value
TM.22		SB	Percentage of women and men age 15–49 years who had sex with more than one partner in the last 12 months Women Men	1.3 6.6
TM.23		SB	Percentage of women and men age 15–49 years reporting having had more than one sexual partner in the last 12 months who reported that a condom was used the last time they had sex Women Men	21.1 49.4
TM.24		SB	Percentage of women and men age 15–24 years who had sex before age 15 Women Men	0.7 4.9
TM.25		SB	Percentage of never married women and men age 15–24 years who have never had sex Women Men	73.9 49.0
TM.26		SB	Percentage of women age 15–24 years reporting having had sex in the last 12 months who had a partner 10 or more years older	3.0
TM.27		SB	Percentage of women and men age 15–24 years reporting having had sex in the last 12 months who had a non-marital, non-cohabitating partner Women Men	35.7 73.6
TM.28		SB	Percentage of women and men age 15–24 years reporting having had sex in the last 12 months with a non-marital, non-cohabitating partner who reported that a condom was used the last time they had sex Women Men	41.8 73.1
TM.29		HA	Percentage of women and men age 15–24 years who correctly identify the two ways of preventing the sexual transmission of HIV ¹³ , who know that a healthy-looking person can be HIV-positive and who reject the two most common misconceptions about HIV transmission (HIV cannot be transmitted by mosquito bites and sharing food with a person who has HIV) Women Men	20.2 20.2

10 Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. SISS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by SISS. The latter cases are included here as long as the current international methodology allows for only the way that the SISS indicator is defined, and/or a significant part of the SDG indicator can be generated by the SISS/MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>

11 Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

12 All SISS/MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

13 Using condoms and limiting sex to one faithful, uninfected partner

TM.30	Knowledge of mother-to-child transmission of HIV		HA	Percentage of women and men age 15–49 years who correctly identify all three means ¹⁴ of mother-to-child transmission of HIV Women Men	31.7 22.6
TM.31	Discriminatory attitudes towards people living with HIV		HA	Percentage of women and men age 15–49 years reporting having heard of HIV who report discriminatory attitudes ¹⁵ toward people living with HIV Women Men	64.9 62.2
TM.32	People who know where to be tested for HIV		HA	Percentage of women and men age 15–49 years who state knowledge of a place to be tested for HIV Women Men	73.0 59.5
TM.33	People who have been tested for HIV and know the results		HA	Percentage of women and men age 15–49 years who report having been tested for HIV in the last 12 months and know their results Women Men	26.0 16.8
TM.34	Sexually active young people who have been tested for HIV and know the results		HA	Percentage of women and men age 15–24 years reporting having had sex in the last 12 months, who have been tested for HIV in the last 12 months and know their results Women Men	35.6 16.9
TM.35a TM.35b	HIV counselling during antenatal care		HA	Percentage of women age 15–49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit received (a) counselling on HIV ¹⁶ (b) information or counselling on HIV after receiving the HIV test results	21.1 17.6
TM.36	HIV testing during antenatal care		HA	Percentage of women age 15–49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit were offered and accepted an HIV test and received test results	53.0
TM.37	Male circumcision		MMC	Percentage of men age 15–49 years who report having been circumcised	4.8
TM.S4	Abortion ratio		AB/BH	Number of abortions per 1,000 live birth	125.0
TM.S5	General abortion rate		AB	Number of abortions per 1,000 women aged between 15–49 years	13.4
TM.S6	Total abortion rate		AB	Total abortion rate for women age 15–49 years	0.4
TM.S7	Institutional abortion		AB	Percentage of women age 15–49 years with abortion in the last 2 years whose most recent abortion was performed in a health facility	98.5

¹⁴ Transmission during pregnancy, during delivery, and by breastfeeding.

¹⁵ Respondents who answered no to either of the following two questions: 1) Would you buy fresh vegetables from a shopkeeper or vendor if you knew that this person had HIV? 2) Do you think children living with HIV should be able to attend school with children who are HIV negative?

¹⁶ Someone talked with the respondent about all three of the following topics: 1) Babies getting the HIV from their mother, 2) preventing HIV and 3) getting tested for HIV.

SISS INDICATOR		SDG ¹	Module ²	Description ³	Value
CHILD HEALTH, NUTRITION AND DEVELOPMENT					
TC.1	Tuberculosis immunization coverage		IM	Percentage of children age 12–23 months who received BCG containing vaccine at any time before the survey	98.0
TC.2	Polio immunization coverage		IM	Percentage of children age 12–23 months who received at least one dose of Inactivated Polio Vaccine (IPV) and the third/fourth dose of either IPV or Oral Polio Vaccine (OPV) vaccines at any time before the survey	92.0
TC.3 TC.4 TC.5	Diphtheria, tetanus and pertussis (DTP) immunization coverage	3.b.1 & 3.8.1	IM	Percentage of children age 12–23 months who received the third dose of DTP containing vaccine (DTP3) at any time before the survey	91.9
	Hepatitis B immunization coverage		IM	Percentage of children age 12–23 months who received the third/fourth dose of Hepatitis B containing vaccine (HepB3) at any time before the survey	91.9
	Haemophilus influenzae type B (Hib) immunization coverage		IM	Percentage of children age 12–23 months who received the third dose of Hib containing vaccine (Hib3) at any time before the survey	91.9
TC.8	Rubella immunization coverage		IM	Percentage of children age 12–23 months who received rubella containing vaccine at any time before the survey	91.6
TC.10	Measles immunization coverage	3.b.1	IM	Percentage of children age 30–35 months who received the second measles containing vaccine at any time before the survey	81.3
TC.11a TC.11b	Full immunization coverage ¹⁷		IM	Percentage of children who at age	
				a) 12–23 months had received all basic vaccinations at any time before the survey	86.9
				b) 30–35 months had received all vaccinations recommended in the national immunization schedule	68.8
TC.12	Care-seeking for diarrhoea		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	51.3
TC.13a TC.13b	Diarrhoea treatment with oral rehydration salt solution (ORS) and zinc		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received	
				a) ORS	58.2
				b) ORS and zinc	13.1
TC.14	Diarrhoea treatment with oral rehydration therapy (ORT) and continued feeding		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received ORT (ORS packet, pre-packaged ORS fluid, recommended homemade fluid or increased fluids) and continued feeding during the episode of diarrhoea	71.0
TC.15	Primary reliance on clean fuels and technologies for cooking		EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking (living in households that reported cooking)	50.0
TC.16	Primary reliance on clean fuels and technologies for space heating		EU	Percentage of household members with primary reliance on clean fuels and technologies for space heating (living in households that reported the use of space heating)	31.3
TC.17	Primary reliance on clean fuels and technologies for lighting		EU	Percentage of household members with primary reliance on clean fuels and technologies for lighting (living in households that reported the use of lighting)	99.8

¹⁷ Basic vaccinations include: BCG, 3 doses of polio, 3 doses of DTP and 1 dose of MMR vaccination. All vaccinations include all doses of vaccinations recommended for children under age 2 years in the national schedule.

SISS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.18	Primary reliance on clean fuels and technologies for cooking, space heating and lighting	7.1.2	EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking, space heating and lighting ¹⁸	31.0
TC.19	Care-seeking for children with acute respiratory infection (ARI) symptoms	3.8.1	CA	Percentage of children under age 5 with ARI symptoms in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	76.0
TC.20	Antibiotic treatment for children with ARI symptoms		CA	Percentage of children under age 5 with ARI symptoms in the last 2 weeks who received antibiotics	66.6
TC.30	Children ever breastfed		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were ever breastfed	98.0
TC.31	Early initiation of breastfeeding		MN	Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	70.2
TC.32	Exclusive breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who are exclusively breastfed ¹⁹	50.2
TC.33	Predominant breastfeeding under 6 months		BD	Percentage of infants under 6 months of age who received breast milk as the predominant source of nourishment ²⁰ during the previous day	61.2
TC.34	Continued breastfeeding at 1 year		BD	Percentage of children age 12–15 months who received breast milk during the previous day	80.7
TC.35	Continued breastfeeding at 2 years		BD	Percentage of children age 20–23 months who received breast milk during the previous day	46.3
TC.36	Duration of breastfeeding		BD	The age in months when 50 percent of children age 0–35 months did not receive breast milk during the previous day	20.9
TC.37	Age-appropriate breastfeeding		BD	Percentage of children age 0–23 months appropriately fed ²¹ during the previous day	64.0
TC.38	Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6–8 months who received solid, semi-solid or soft foods during the previous day	88.4
TC.39a TC.39b	Minimum acceptable diet		BD	Percentage of children age 6–23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day (a) breastfed children (b) non-breastfed children	31.8 17.4
TC.40	Milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6–23 months who received at least 2 milk feedings during the previous day	68.4
TC.41	Minimum dietary diversity		BD	Percentage of children age 6–23 months who received foods from 5 or more food groups ²² during the previous day	39.2

18 Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator

19 Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines

20 Infants who receive breast milk and certain fluids (water and water-based drinks, fruit juice, ritual fluids, oral rehydration solution, drops, vitamins, minerals, and medicines), but do not receive anything else (in particular, non-human milk and food-based fluids)

21 Infants age 0–5 months who are exclusively breastfed, and children age 6–23 months who are breastfed and ate solid, semi-solid or soft foods

22 The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

SISS INDICATOR		SDG ¹	Module ²	Description ³	Value
TC.42	Minimum meal frequency		BD	Percentage of children age 6–23 months who received solid, semi-solid and soft foods (plus milk feeds for non-breastfed children) the minimum number of times ²³ or more during the previous day	65.9
TC.43	Bottle feeding		BD	Percentage of children age 0–23 months who were fed with a bottle during the previous day	36.8
TC.44a TC.44b	Underweight prevalence		AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for age of the WHO standard	1.8 0.5
TC.45a TC.45b	Stunting prevalence	2.2.1	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) below minus three standard deviations (severe) of the median height for age of the WHO standard	9.4 2.3
TC.46a TC.46b	Wasting prevalence	2.2.2	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe) of the median weight for height of the WHO standard	0.9 0.3
TC.47a TC.47b	Overweight prevalence	2.2.2	AN	Percentage of children under age 5 who are above (a) two standard deviations (moderate and severe) (b) three standard deviations (severe) of the median weight for height of the WHO standard	10.5 2.9
TC.48	Iodized salt consumption		SA	Percentage of households with salt testing positive for any iodide/iodate among households in which salt was tested or where there was no salt	75.1
TC.49a TC.49b TC.49c	Early stimulation and responsive care		EC	Percentage of children age 24–59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with (a) Any adult household member (b) Father (c) Mother	57.6 15.6 37.7
TC.50	Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	28.6
TC.51	Availability of playthings		EC	Percentage of children under age 5 who play with two or more types of playthings	65.1
TC.52	Inadequate supervision		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	12.5
TC.53	Early child development index	4.2.1	EC	Percentage of children age 36–59 months who are developmentally on track in at least three of the following four domains: literacy–numeracy, physical, social–emotional, and learning	75.7

²³ Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6–8 months, and three times for children 9–23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6–23 months.

SISS INDICATOR	SDG ¹	Module ²	Description ³	Value
TC.S1 Early child development index (based on country specific definition)		EC	Percentage of children age 36–59 months who are developmentally on track in at least three of the following four domains: literacy–numeracy, physical, social–emotional, and learning (Country specific definition differences from the standard definition: Literacy–numeracy skill included can identify some colours, simple shapes and excluded recognition of numbers 1 to 10 and ability to read at least four simple words. Physical skills included ability to hold a spoon, fork or a pencil using the thumb, index finger and middle finger.)	87.5

LEARN					
LN.1	Attendance to early childhood education		UB	Percentage of children age 36–59 months who are attending an early childhood education programme	73.6
LN.2	Participation rate in organised learning (adjusted)	4.2.2	ED	Percentage of children in the relevant age group (one year before the official primary school entry age) who are attending an early childhood education programme or primary school	84.3
LN.3	School readiness		ED	Percentage of children attending the first grade of primary school who attended early childhood education programme during the previous school year	85.0
LN.4	Net intake rate in primary education		ED	Percentage of children of school–entry age who enter the first grade of primary school	92.0
LN.5a LN.5b LN.5c	Net attendance ratio (adjusted)		ED	Percentage of children of (a) primary school age currently attending primary or secondary school (b) lower secondary school age currently attending lower secondary school or higher (c) upper secondary school age currently attending upper secondary school or higher	96.1 93.0 86.5
LN.6a LN.6b LN.6c	Out-of-school rate		ED	Percentage of children of (a) primary school age who are not attending early childhood education, primary or lower secondary school (b) lower secondary school age who are not attending primary school, lower or upper secondary school or higher (c) upper secondary school age who are not attending primary school, lower or upper secondary school or higher	3.6 4.6 12.8
LN.7a LN.7b	Gross intake rate to the last grade		ED	Percentage of children of completion age (age appropriate to final grade) attending the last grade (excluding repeaters) (a) Primary school (b) Lower secondary school	92.5 98.6
LN.8a LN.8b LN.8c	Completion rate		ED	Percentage of children age 3–5 years above the intended age for the last grade who have completed that grade (a) Primary school (b) Lower secondary school (c) Upper secondary school	98.4 92.1 70.5
LN.9	Effective transition rate to lower secondary school		ED	Percentage of children attending the last grade of primary school during the previous school year who are not repeating the last grade of primary school and in the first grade of lower secondary school during the current school year	97.3

SISS INDICATOR		SDG ¹	Module ²	Description ³	Value
LN.11a LN.11b LN.11c	Education Parity Indices (a) Gender (b) Wealth (c) Area	4.5.1	ED	Net attendance ratio (adjusted) for girls divided by net attendance ratio (adjusted) for boys (a) primary school (b) lower secondary school (c) upper secondary school	1.02 1.03 1.13

PROTECTED FROM VIOLENCE AND EXPLOITATION					
PR.1	Birth registration	16.9.1	BR	Percentage of children under age 5 whose births are reported registered with a civil authority	99.6
PR.2	Violent discipline	16.2.1	UCD – FCD	Percentage of children age 1–14 years who experienced any physical punishment and/or psychological aggression by caregivers in the past one month	49.1
PR.3	Child labour	8.7.1	CL	Percentage of children age 5–17 years who are involved in child labour ²⁴	16.7
PR.4a PR.4b	Child marriage	5.3.1	MA	Percentage of women and men age 20–24 years who were first married or in union Women (a) before age 15 (b) before age 18 Men (a) before age 15 (b) before age 18	0.9 12 0.0 2.1
PR.5	Young people age 15–19 years currently married or in union		MA	Percentage of women and men age 15–19 years who are married or in union Women Men	3.9 1.1
PR.7a PR.7b	Spousal age difference		MA	Percentage of women who are married or in union and whose spouse is 10 or more years older, (a) among women age 15–19 years (b) among women age 20–24 years	0.0 3.7
PR.12	Experience of robbery and assault		VT	Percentage of women and men age 15–49 years who experienced physical violence of robbery or assault within the last 12 months Women Men	5.9 7.2
PR.13	Crime reporting	16.3.1	VT	Percentage of women and men age 15–49 years experiencing physical violence of robbery and/or assault in the last 12 months and reporting the last incidences of robbery and/or assault experienced to the police Women Men	41.0 28.0
PR.14	Safety	16.1.4	VT	Percentage of women and men age 15–49 years feeling safe walking alone in their neighbourhood after dark Women Men	54.8 83.7
PR.15	Attitudes towards domestic violence		DV	Percentage of women and men age 15–49 years who state that a husband is justified in hitting or beating his wife in at least one of the following circumstances: (1) she goes out without telling him, (2) she neglects the children, (3) she argues with him, (4) she refuses sex with him, (5) she burns the food Women Men	9.3 4.8

²⁴ Children involved in child labour are defined as children involved in economic activities above the age-specific thresholds, children involved in household chores above the age-specific thresholds, and children involved in hazardous work. See Tables PR.3.1–3 for more detailed information on thresholds and classifications.

SISS INDICATOR		SDG ¹	Module ²	Description ³	Value
LIVE IN A SAFE AND CLEAN ENVIRONMENT					
WS.1	Use of improved drinking water sources		WS	Percentage of household members using improved sources of drinking water	86.9
WS.2	Use of basic drinking water services	1.4.1	WS	Percentage of household members using improved sources of drinking water either in their dwelling/yard/plot or within 30 minutes round trip collection time	82.5
WS.3	Availability of drinking water		WS	Percentage of household members with a water source that is available when needed	85.5
WS.4	Faecal contamination of source water		WQ	Percentage of household members whose source water was tested and with E. coli contamination in source water	16.0
WS.5	Faecal contamination of household drinking water		WQ	Percentage of household members whose household drinking water was tested and with E. coli contamination in household drinking water	19.7
WS.6	Use of safely managed drinking water services	6.1.1	WS – WQ	Percentage of household members with an improved drinking water source on premises, whose source water was tested and free of E. coli and available when needed	22.1
WS.7	Handwashing facility with water and soap	1.4.1 & 6.2.1	HW	Percentage of household members with a handwashing facility where water and soap or detergent are present	81.8
WS.8	Use of improved sanitation facilities	3.8.1	WS	Percentage of household members using improved sanitation facilities	88.8
WS.S1	Use of improved sanitation facilities (based on country specific definition)		WS	Percentage of household members using improved sanitation facilities (Country specific definition excluded pit latrine with slab from the standard definition)	33.5
WS.9	Use of basic sanitation services	1.4.1 & 6.2.1	WS	Percentage of household members using improved sanitation facilities which are not shared	69.0
WS.10	Safe disposal in situ of excreta from on-site sanitation facilities	6.2.1	WS	Percentage of household members with an improved sanitation facility that does not flush to a sewer and with waste never emptied or emptied and buried in a covered pit	95.1
WS.11	Removal of excreta for treatment off-site	6.2.1	WS	Percentage of household members with an improved sanitation facility that does not flush to a sewer and with waste removed by a service provider for treatment off-site	2.9
WS.12	Menstrual hygiene management		UN	Percentage of women age 15–49 years reporting menstruating in the last 12 months and using menstrual hygiene materials with a private place to wash and change while at home	82.3
WS.13	Exclusion from activities during menstruation		UN	Percentage of women age 15–49 years reporting menstruating in the last 12 months who did not participate in social activities, school or work due to their last menstruation	3.2

EQUITABLE CHANCE IN LIFE					
EQ.1	Children with functional difficulty		UCF – FCF	Percentage of children age 2–17 years reported with functional difficulty in at least one domain	5.1
EQ.7	Discrimination	10.3.1 & 16.b.1	VT	Percentage of women and men age 15–49 years having personally felt discriminated against or harassed within the previous 12 months on the basis of a ground of discrimination prohibited under international human rights law Women Men	16.3 14.6

EQ.9a EQ.9b	Overall life satisfaction index		LS	Average life satisfaction score for women and men Women (a) age 15–24 (b) age 15–49 Men (a) age 15–24 (b) age 15–49	6.7 6.8 6.7 6.6
EQ.10a EQ.10b	Happiness		LS	Percentage of women and men who are very or somewhat happy Women (a) age 15–24 (b) age 15–49 Men (a) age 15–24 (b) age 15–49	86.2 84.5 88.4 86.5
EQ.11a EQ.11b	Perception of a better life		LS	Percentage of women and men whose life improved during the last one year and who expect that their life will be better after one year Women (a) age 15–24 (b) age 15–49 Men (a) age 15–24 (b) age 15–49	64.3 56.6 62.8 51.5

SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS

4.1 RESULTS OF INTERVIEWS

Table SR.1.1 presents results of the sample implementation, including response rates. Of the 14,500 households selected for the sample, 14,041 were found occupied. Of these, 13,798 were successfully interviewed for a household response rate of 98.3 percent.

The Water Quality Testing Questionnaire was administered to 5 randomly selected households in each of the 580 clusters. Of the total 2,900 selected households, 2,736 were successfully tested for household drinking water yielding a response rate of 94.3 percent. Also, 2,598 were successfully tested for source drinking water quality yielding a response rate of 89.6 percent.

In the interviewed households, 11,737 women (age 15–49 years) were identified. Of these, 10,794 were successfully interviewed, yielding a response rate of 92.0 percent within the interviewed households.

The survey also sampled men (age 15–49), but required only a subsample. All men (age 15–49) were identified in every one of two households. A total of 5,513 men (age

15–49 years) were listed in the household questionnaires. Questionnaires were completed for 4,477 eligible men, which corresponds to a response rate of 81.2 percent within eligible interviewed households.

There were 6,269 children under age five listed in the household questionnaires. Questionnaires were completed for 6,091 of these children, which corresponds to a response rate of 97.2 percent within interviewed households.

A sub-sample of children age 5–17 years was used to administer the questionnaire for children age 5–17. Only one child has been selected randomly in each household interviewed, and there were 13,025 children age 5–17 years listed in the household questionnaires. Of these, 7,628 children were selected, and questionnaires were completed for 7,427 which corresponds to a response rate of 97.4 percent within the interviewed households.

Overall response rates of 90.4 percent, 79.8 percent, 95.5 percent, 95.7 percent are calculated for the individual interviews of women, men, under-5s, and children age 5–17 years, respectively.

Table SR.1.1: Results of household, water quality testing, women's, men's, under-5's and children age 5–17's interviews

4.2 HOUSING AND HOUSEHOLD CHARACTERISTICS

SISS collected information on housing and household characteristics. Most of the information collected on these housing and household characteristics have been used in the construction of the wealth index. Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on household level characteristics obtained in the Household Questionnaire.

Table SR.2.1 presents characteristics of housing, disaggregated by area and region, distributed by whether

the dwelling has electricity, energy used for cooking, internet access, the main materials of the flooring, roof, and exterior walls, as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows how the household populations in areas and regions are distributed according to household wealth quintiles.

4.3 HOUSEHOLD COMPOSITION

Tables SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, region, area, number of household members, education of household head, and ethnicity. Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample.

The remaining tables in this report are presented only with weighted numbers.¹

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalized.¹ The table also shows the weighted mean household size estimated by the survey.

¹ See Appendix A: Sample design, for more details on sample weights.

Table SR.3.1: Household composition				
Percent and frequency distribution of households by selected characteristics, Mongolia, 2018				
	Weighted percent	Number of households

4.4 AGE STRUCTURE OF HOUSEHOLD POPULATION

The weighted age and sex distribution of the survey population is provided in Table SR.4.1. In the households

successfully interviewed in the survey, a weighted total of 50,057 household members was listed. Of these, 24,403 were males, and 25,655 were females.²

Table SR.4.1: Age distribution of household population by sex						
Percent and frequency distribution of the household population by five-year age groups, dependency age groups, and by child (age 0–17 years) and adult populations (age 18 or more), by sex, Mongolia, 2018						
	Males		Females		Total	
	Number	Percent	Number	Percent	Number	Percent

Child and adult populations						
Children age 0–17 years	9,671	39.6	9,123	35.6	18,794	37.5
Adults age 18+ years	14,732	60.4	16,531	64.4	31,263	62.5

2 The single year age distribution is provided in Table DQ.1.1 in Appendix D: Data quality

4.5 RESPONDENTS' BACKGROUND CHARACTERISTICS

Tables SR.5.1W, SR.5.1M, SR.5.2, and SR.5.3 provide information on the background characteristics of female and male respondents 15–49 years of age, children under age 5 and children age 5–17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized).

In addition to providing useful information on the background characteristics of women, men, children age 5–17, and children under age five, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

Tables SR.5.1W and SR.5.1M provide background characteristics of female and male respondents, age 15–49 years. The tables include information on the distribution of women and men according to area, region, age, education³, marital/union status, motherhood/fatherhood status, health insurance, functional difficulties (for age 18–49), ethnicity of the household head, and wealth index quintiles.^{4, 5}

Background characteristics of children age 5–17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area, region, age in months, mother's (or caretaker's) education, respondent type, health insurance, functional difficulties (for children under age 5 only for age 2–4 years), ethnicity of the household head and wealth index quintiles.

3 Note that throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level attained by the respondent, in contrast to the MICS standards in which the background variable "education" refers to the highest education level ever attended by the respondent.

4 The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimize the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in, and is finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest).

In SISS 2018, the following assets were used in these calculations: Main materials of the flooring, roof, and exterior walls, and their insulation, whether the household erects a barn of their accommodation in the winter, whether the household have fixed telephone line, radio, couch, wardrobe, metal bed, double-size bed, television, refrigerator, freezer, vacuum cleaner, microwave, oven, mixer, electric cooker, coffee maker, rice cooker, bread maker, automatic or semi-automatic washing machine, air purifier, air humidifier, photo/video camera, bicycle, motorcycle, animal drawn cart, SUV, sedan, microbus, truck, tractor, household member's ownership of wristwatch, computer/notebook/tablet, cell phone, bank account, whether the dwelling has access to electricity and internet, household's ownership of land usable for agriculture and its size, mainly used cook stove and its energy source, mainly used space heating system and its energy source, household lighting, source for drinking water, type of toilet facility, toilet facility location and whether it's shared, handwashing station and whether there is water and/or soap present. The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data — or Tears: An Application to Educational Enrollments in States of India*." *Demography* 38, no. 1 (2001): 115–32. doi:10.1353/dem.2001.0003.;

Rutstein, S., and K. Johnson. *The DHS Wealth Index*. DHS Comparative Reports No. 6. Calverton: ORC Macro, 2004. <https://dhsprogram.com/pubs/pdf/CR6/CR6.pdf>;

Rutstein, S. *The DHS Wealth Index: Approaches for Rural and Urban Areas*. Calverton: Macro International, 2008. <https://dhsprogram.com/pubs/pdf/WP60/WP60.pdf>.

5 When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

^A In this table and throughout the report, mother's education refers to educational attainment of mothers as well as caretakers of children under 5, who are the respondents to the under–5 questionnaire if the mother is deceased or is living elsewhere.

^B The results of the Child Functioning module are presented in Chapter 11.1.

^C Children age 0–1 years are excluded, as functional difficulties are only collected for age 2–4 years.

^D In this table and throughout the report, mother's functional difficulties refers to functional difficulty of mothers as well as caretakers of children under 5 as mentioned in note A. The category of «No information» applies to mothers or caretakers to whom the Adult Functioning module was not administered, e.g. the mother is below age 18 or above age 49. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

^A In this table and throughout the report where applicable, mother-s education refers to educational attainment of mothers as well as caretakers of children age 5–17, who are the respondents to the children age 5–17 questionnaire if the mother is deceased or is living elsewhere. For emancipated children this is the education status of the selected child.

^B Children age 15–17 years were considered emancipated and individually interviewed if not living with his/her mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caretaker.

^C The results of the Child Functioning module is presented in Chapter 11.1.

^D In this table and throughout the report, mother-s functional difficulties refers to functional difficulty of mothers as well as caretakers of children age 5–17 as mentioned in note A. The category of «No information» applies to mothers or caretakers to whom the Adult Functioning module was not administered, e.g. the mother is below age 18 or above age 49. Emancipated children are also included here. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

4.6 LITERACY

The literacy rate reflects the outcomes of primary education over the previous 30–40 years. As a measure of the effectiveness of the primary education system, it is often seen as a proxy measure of social progress and economic achievement. In MICS, literacy is assessed on the ability of the respondent to read a short simple statement⁶ or based on school attendance.

Tables SR.6.1W and SR.6.1M show the survey findings for the total number of interviewed women and men, respectively. The Youth Literacy Rate, MICS Indicator SR.2, is calculated for women and men age 15–24 years and presented in the Age disaggregate in the two tables.

Note that those who have ever attended basic (lower secondary) or higher education are immediately classified as literate, due to their education level and are therefore not asked to read the statement. All others who successfully read the statement are also classified as literate. The tables are designed as full distributions of the survey respondents, by level of education ever attended. The total percentage literate presented in the final column is the sum of literate individuals among those with 1) pre–primary or no education, 2) primary education and 3) those with at least some basic (lower secondary) education.

The percent missing includes those for whom no sentence in the required language was available, uses braille (visually impaired) or for whom no response was reported.

⁶ Short statements used in the survey were developed in Mongolian and Kazakh languages.

4.7 MIGRATORY STATUS

The Background module of the SISS 2018 asked respondents to the Individual Questionnaire for Women and Men how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in the capital city, aimag center, soum center bagh,

rural bagh or a foreign country and the name of the aimag or country they lived in before moving to their current place of residence. Tables SR.7.1W and 7.1.M present the percentage of women and men who have changed residence according to the time since last move and also presents the most recent location of residence of each individual at the time of the survey.

Table SR.7.1W: Migratory status of women

		Years since most recent migration					Percentage of women, by time of last move					Most recent migration was from:					Number of women who changed residence
		Never migrated	Less than one year	1-4 years	5-9 years	10 years or more	Missing	Total	Number of women	Capital city	Aimag center	Soum center	Rural bagh	Abroad	Missing	Total

^A The category of "Don't know/Missing" in the background characteristic of "Education", "Functional difficulty (age 18–49 years)", and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

4.8 ADULT FUNCTIONING

The Adult Functioning module is based on the “short set” of questions developed by the Washington Group on Disability Statistics (WG) – a UN City Group established under the United Nations Statistical Commission. These questions reflect six domains for measuring disability: seeing, hearing, walking, cognition, self-care and communication. This module was included for the first time into the SISS for the purpose of disaggregation of SDG indicators for adults.⁷

The MICS6 standard questionnaires include these questions in the individual questionnaires as specified previously. For women and men age 18–49, data are obtained directly from the respondents themselves.⁸

Information at the individual level can also be obtained through a proxy respondent using a roster approach of these questions in the household questionnaire. This would necessitate a single proxy respondent answering on behalf of all adult household members. A proxy respondent can identify a large proportion of difficulties, but tend to under-identify persons with functional difficulties, either deliberately or inadvertently.⁹

Self-reporting too can have methodological issues. Specifically, a self-reported approach can bias the total sample, as some individuals cannot be interviewed due to their disability (labeled as “incapacitated” in the result code of the individual questionnaires by the interviewers). The number of “incapacitated” individuals identified in household surveys is generally very low (usually around 0.5%) and

holds both those incapacitated for reasons of disability and those incapacitated for any reason (e.g., sick in bed).

Regardless, to avoid such potential bias, the Adult Functioning data in MICS should not be used to estimate prevalence in the household population age 18–49 years. The standard tabulations of MICS do therefore not include such. These data are however the recommended methodology to allow countries to disaggregate the SDG indicators by disability status – the objective behind the inclusion of the module. It is important to interpret the disaggregate with the bias in mind: The data is representative for the household population age 18–49 for which an interview was completed and functioning difficulty is sometimes the reason for incomplete questionnaires.

The recommendation of the WG is to use a proxy respondent for those individuals who cannot respond for themselves, as this would allow estimation of prevalence in the household population age 18–49 years. This approach is not currently sought by SISS, as the majority of data captured in individual questionnaires cannot be collected through a proxy respondent (e.g. the SDG indicators on fertility, child mortality, family planning, delivery attendance, early marriage, victimization, etc.).

Tables SR.8.1W and SR.8.1M present the percentage of women and men age 18–49 years with functional difficulties by domain, and percentage who use assistive devices (wearing glasses/ contact lenses or hearing aid) and have functional difficulty with seeing, or hearing.

7 IAEG-SDG's. Disability Data Disaggregation. Joint Statement by the Disability Sector, Geneva, 2016. <http://www.washingtongroup-disability.com/wp-content/uploads/2016/01/Joint-statement-on-disaggregation-of-data-by-disability-Final.pdf>.

8 Note that the Adult Functioning module does not cover adults over age 49 years which is the population most at risk of having a functional limitation due to aging.

^a In MICS/SSS, the adult functioning module is asked to individual respondents age 18–49 for the purpose of disaggregation. No information is collected on eligible household members who, for any reason, were unable to complete the interview. It is expected that a significant proportion of the 33 cases of respondents for whom the response code "Incapacitated" was indicated for the individual interview are indeed incapacitated due to functional difficulties. The percentage of women with functional difficulties presented here is therefore not representing a full measure and should not be used for reporting on prevalence in the population.

^b The category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

Table SR.8.1M: Adult functioning (men age 18–49 years)

Percentage of men age 18–49 years with functional difficulties, by domain, and percentage who use assistive devices and have functional difficulty within domain of devices, Mongolia, 2018														
Percentage of men who: _____														
in the domains of:														
	Wear glasses/ contact lenses	Use hearing aid	Seeing	Hearing	Walking	Self-care	Communication	Remembering	Percentage of men age 18–49 years with functional difficulties in at least one domain ^a	Number of men age 18–49 years	Percentage of men with difficulties seeing when wearing glasses/ contact lenses	Number of men age 18–49 years who wear glasses/ contact lenses	Percentage of men with difficulties hearing when using hearing aid	Number of men age 18–49 years who use hearing aid

^a In MICS/SSS, the adult functioning module is asked to individual respondents age 18–49 for the purpose of disaggregation. No information is collected on eligible household members who, for any reason, were unable to complete the interview. It is expected that a significant proportion of the 53 cases of respondents for whom the response code "Incapacitated" was indicated for the individual interview are indeed incapacitated due to functional difficulties. The percentage of men with functional difficulties presented here is therefore not representing a full measure and should not be used for reporting on prevalence in the population.

^b The category of "Don't know/missing" in the background characteristic of "Education" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

4.9 MASS MEDIA AND ICT

The SISS 2018 collected information on exposure to mass media and the use of computers and the internet. Information was collected on exposure to newspapers/magazines, radio and television among women and men age 15–49 years and is presented in Tables SR.9.1W and SR.9.1M.

Table SR.9.2 presents information on the household ownership of Information and Communication Technology (ICT) equipment (radio, television, fixed telephone line or mobile telephone¹⁰ and computer) and access to internet.

Tables SR.9.3W and SR.9.3M present the use of ICT by women and men age 15–49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while tables SR.9.4W and SR.9.4M present the ICT skills of women and men age 15–49 years based on the information about whether they carried out from the nine specific activities using a computer (excluding small–screen devices such as tablets, mobile phones, calculator etc.) in the last three months.

Table SR.9.1W: Exposure to mass media (women)

¹ SISS/MICS indicator SR.3 – Exposure to mass media

^A The category of "Don't know/Missing" in the background characteristic of "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

10 In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman (or man) age 15–49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women and men age 15–49 years.

4.10 TOBACCO AND ALCOHOL USE

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.¹¹ If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The consumption of alcohol carries a risk of adverse health and social consequences related to its intoxicating, toxic and dependence-producing properties. In addition to the chronic diseases that may develop in those who drink large amounts of alcohol over a number of years, alcohol use is also associated with an increased risk of acute health conditions, such as injuries, including from traffic accidents.¹²

Alcohol use also causes harm far beyond the physical and psychological health of the drinker. It harms the well-being

and health of people around the drinker. An intoxicated person can harm others or put them at risk of traffic accidents or violent behaviour, or negatively affect co-workers, relatives, friends or strangers. Thus, the impact of the harmful use of alcohol reaches deep into society.¹³

The SISS 2018 collected information on ever and current use of tobacco and alcohol and intensity of use among women and men age 15–49 years. This section presents the main results.

Table SR.10.1W presents the current and ever use of tobacco products by women age 15–49 years, and Table SR.10.1M presents the corresponding information for men of the same age group.

Tables SR.10.2W and SR.10.2M present results on age at first use of cigarettes, as well as frequency of use, for women and men respectively.

Table SR.10.3W and SR.10.3M show the use of alcohol among women and men age 15–49 years.

4.11 CHILDREN'S LIVING ARRANGEMENTS

The Convention on the Rights of the Child (CRC) recognizes that “the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding”. Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children's living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child's care and wellbeing.

Table SR.11.1 presents information on the living arrangements and orphanhood status of children under age 18.

The SISS 2018 included a simple measure of one particular aspect of migration related to what is termed “children left behind”, i.e. for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psycho-social effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.11.2 presents information on the living arrangements and co-residence with parents of children under age 18.

Table SR.11.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

Table SR.11.1: Children's living arrangements and orphanhood

	Percent distribution of children age 0–17 years according to living arrangements, percentage of children age 0–17 years not living with a biological parent and percentage of children who have one or both parents dead, Mongolia, 2018											Number of children age 0–17 years

¹SISS/MICS indicator SR.20 - Children with at least one parent living abroad

^A Includes parents living abroad as well as those living elsewhere in the country.

With the SDG target (3.2) for child mortality, on ending preventable deaths of newborns and children under 5 years of age, the international community has retained the overarching goal of reducing child mortality. While the global target calls for reducing neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births, reduction of child mortality continues to be one of the most important objectives in national plans and programmes in each and every country.

Mortality rates presented in this chapter are calculated from information collected in the birth histories of the Women's Questionnaire. All interviewed women were asked whether they had ever given birth, and those who had were asked to report the number of sons and daughters who live with them, the number who live elsewhere, and the number who have died. In addition, women were asked to provide detailed information on their live births, starting with the firstborn, in chronological order. This information included whether births were single or multiple, and for each live birth, sex, date of birth (month and year), and survival status. Further, for children alive at the time of survey, women were asked the current age of the child; for deceased children, the age at death was obtained.

Unfortunately, a small proportion of cases of deceased children in Mongolia, especially in Central region were reported by the mothers due to unmeasurable factors of the retrospective interviews. During secondary editing such unreasonable patterns were identified and checked their validity with other sources, including health records and civil registry. Even in some cases, back check with the interviewees were undertaken, but the consequence

remained unresolved. However, child mortality estimates disaggregated by other locality variables such as urban rural area, capital city, aimag center, soum center bagh and rural bagh are not affected much. Taken all these evidence into the consideration, it is decided the child mortality rates at the regional and provincial level to suppress from the main tables in this chapter and Appendix A to avoid the confusion among users. Standard errors of the rates can be found in Appendix C (Estimates of sampling error).

Childhood mortality rates are expressed by conventional age categories and are defined as follows:

- Neonatal mortality (NN): probability of dying within the first month of life¹
- Post-neonatal mortality (PNN): difference between infant and neonatal mortality rates
- Infant mortality (1q0): probability of dying between birth and the first birthday
- Child mortality (4q1): probability of dying between the first and the fifth birthdays
- Under-five mortality (5q0): the probability of dying between birth and the fifth birthday

Neonatal, infant and under-five mortality rates are expressed as deaths per 1,000 live births. Child mortality is expressed as deaths per 1,000 children surviving to age one. Post-neonatal mortality is calculated as the difference between infant and neonatal mortality rates.

Table CS.1 presents neonatal, post-neonatal, infant, child, and under-five mortality rates for the three most recent five-year periods before the survey. For each mortality rate in the

¹ The neonatal period is the first 28 days of life, however, traditionally the neonatal mortality rates are computed based on the first month of life in household surveys, which very closely approximates the 28-day definition.

table, it is possible to assess changes over time, during the last 15 years preceding the survey.

Tables CS.2 and CS.3 provide estimates of child mortality by socioeconomic and demographic characteristics. Using the

rates calculated for the 5-year period immediately preceding the survey, differentials in mortality rates by socioeconomic characteristics, such as urban/rural, mother's education and wealth, and by demographic characteristics such as sex and mother's age at birth are presented.

Figure CS.1: Trends in under-5 mortality rates, Mongolia, 1975–2018

Note: The source data used in the above graph is taken from the final reports of SISS 2018, 2013, CDS 2010, 2005, 2000, RHS 2008, 2003, 1998 and administrative records of Ministry of Health with the exception of Child Mortality Global Datasets which is downloaded from the UN IGME web portal. Child mortality source data and child mortality estimates are published on www.childmortality.org, the web portal of the United Nations Inter-agency Group for Child Mortality Estimation (UN IGME). Data from the same source may differ between a report and UN IGME web portal as UN IGME recalculates estimates using smaller intervals and/or calendar years (if data are available).

THRIVE – REPRODUCTIVE AND MATERNAL HEALTH

6.1 FERTILITY

Measures of current fertility are presented in Table TM.1.1 for the three-year period preceding the survey. A three-year period was chosen for calculating these rates to provide the most current information, while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. The current fertility measures, presented in the table by urban and rural residence, are as follows:

- Age-specific fertility rates (ASFRs), expressed as the number of births per 1,000 women in a specified age group, show the age pattern of fertility. Numerators for ASFRs are calculated by identifying live births that occurred in the three-year period preceding the survey, classified according to the age of the mother (in five-year age groups) at the time of the child's birth. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The total fertility rate (TFR) is a synthetic measure that denotes the number of live births a woman would have if she were subject to the current age-specific fertility rates throughout her reproductive years (15–49 years).
- The general fertility rate (GFR) is the number of live births occurring during the specified period per 1,000 women age 15–49.
- The crude birth rate (CBR) is the number of live births per 1,000 household population during the specified period.

CBR ^D	25.3	23.8	24.8

¹SISS/MICS indicator TM.1 – Adolescent birth rate (age 15–19 years); SDG indicator 3.7.2

^A The age-specific fertility rates (ASFR) are the number of live births in the last 3 years, divided by the average number of women in that age group during the same period, expressed per 1,000 women. The age-specific fertility rate for women age 15–19 years is also termed as the adolescent birth rate.

^B TFR: The Total Fertility Rate is the sum of age-specific fertility rates of women age 15–49 years. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years (by age 50) if current fertility rates prevailed. The rate is expressed per woman age 15–49 years.

^C GFR: The General Fertility Rate is the number of births in the last 3 years divided by the average number of women age 15–49 years during the same period, expressed per 1,000 women age 15–49 years.

^D CBR: The Crude Birth Rate is the number of births in the last 3 years, divided by the total population during the same period, expressed per 1,000 population.

6.2 EARLY CHILDBEARING

Table TM.2.1 presents the survey findings on adolescent birth rates and further disaggregates of the total fertility rate.

The adolescent birth rate (age-specific fertility rate for women age 15–19) is defined as the number of births to women age 15–19 years during the three-year period preceding the survey, divided by the average number of women age 15–19 (number of women-years lived between ages 15 through 19, inclusive) during the same period, expressed per 1,000 women.

The adolescent birth rate is a Global SDG indicator (3.7.2) for ensuring universal access to sexual and reproductive health-care services (Target 3.7).

Tables TM.2.2W and TM.2.2M present a selection of early childbearing and fatherhood indicators for young women and men age 15–19 and 20–24 years. In Table TM.2.2W, percentages among women age 15–19 who have had a live birth and those who are pregnant with their first child are presented. For the same age group, the table also presents

the percentage of women who have had a live birth before age 15. These estimates are all derived from the detailed birth histories of women.

To estimate the proportion of women who have had a live birth before age 18 – when they were still children themselves – data based on women age 20–24 years at the time of survey are used to avoid truncation.¹

Table TM.2.2M presents findings on early fatherhood. Percentages among men age 15–19 and age 20–24 years who became fathers before ages 15 and 18, respectively, show the extent to which men are becoming fathers when they are still children.

Tables TM.2.3W and TM.2.3M are designed to look at trends in early childbearing for women and early fatherhood for men, by presenting percentages of women and men who became mother and fathers before ages 15 and 18, for successive age cohorts. The table is designed to capture trends in urban and rural areas separately.

¹ Using women age 15–19 to estimate the percentage who had given birth before age 18 would introduce truncation to the estimates, since the majority of women in this age group will not have completed age 18, and therefore will not have completed exposure to childbearing before age 18. The age group 20–24 is used to estimate the percentage of women giving birth before age 18, since all women in this age group have completed exposure to childbearing at very early ages.

6.3 CONTRACEPTION

Appropriate contraceptive use is important to the health of women and children by: 1) preventing pregnancies that are too early or too late; 2) extending the period between births; and 3) limiting the total number of children.²

Table TM.3.1 presents the current use of contraception for women who are currently married or in union while Table TM.3.2 presents the same information for women who are not currently married or in union and are sexually active. In Table TM.3.1, use of specific methods of contraception are first presented; specific methods are then grouped into modern and traditional methods and presented as such. For sexually active women who are not currently married or in union, in Table TM.3.2, contraceptive use is only presented by modern and traditional method categories.

Unmet need for contraception refers to fecund women who are not using any method of contraception, but who wish to postpone the next birth (spacing) or who wish to stop childbearing altogether (limiting). Unmet need is identified in SISS by using a set of questions eliciting current behaviours and preferences pertaining to contraceptive use, fecundity, and fertility preferences.

Table TM.3.3 shows the levels of unmet need and met need for contraception, and the demand for contraception satisfied for women who are currently married or in union. The same table is reproduced in Table 3.4 for sexually active women who are not currently married or in union.

Unmet need for spacing is defined as the percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic³ and iii) fecund⁴ and say they want to wait two or more years for their next birth OR

- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and unsure whether they want another child OR
- are pregnant, and say that pregnancy was mistimed (would have wanted to wait) OR
- are post-partum amenorrheic and say that the birth was mistimed (would have wanted to wait).
- Unmet need for limiting is defined as percentage of women who are married or in union and are not using a method of contraception AND
- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and say they do not want any more children OR
- are pregnant and say they did not want to have a child OR
- are post-partum amenorrheic and say that they did not want the birth.

Total unmet need for contraception is the sum of unmet need for spacing and unmet need for limiting.

Met need for limiting includes women who are using (or whose partner is using) a contraceptive method⁵ and who want no more children, are using male or female sterilisation or declare themselves as infecund. Met need for spacing includes women who are using (or whose partner is using) a contraceptive method and who want to have another child or are undecided whether to have another child. Summing the met need for spacing and limiting results in the total met need for contraception.

Using information on contraception and unmet need, the percentage of demand for contraception satisfied is also estimated from the MICS data. The percentage of demand satisfied is defined as the proportion of women who are

2 PATH, and United Nations Population Fund. Meeting the Need: Strengthening Family Planning Programs. Seattle: PATH/UNFPA, 2006. https://www.unfpa.org/sites/default/files/resource-pdf/family_planning06.pdf.

3 A woman is post-partum amenorrheic if she had a live birth in last two years and is not currently pregnant, and her menstrual period has not returned since the birth of the last child.

4 A woman is considered infecund if she is neither pregnant nor post-partum amenorrheic, and (1a) has not had menstruation for at least six months, or (1b) has never menstruated, or (1c) had last menstruation occurring before her last birth, or (1d) is in menopause/has had hysterectomy OR

(2) she declares that she i) has had hysterectomy, ii) has never menstruated, iii) is menopausal or iv) has been trying to get pregnant for at least 2 years without result in response to questions on why she thinks she is not physically able to get pregnant at the time of survey OR

(3) she declares she cannot get pregnant when asked about desire for future birth OR

(4) she has not had a birth in the preceding 5 years, is currently not using contraception and is currently married and was continuously married during the last 5 years preceding the survey.

5 In this chapter, whenever reference is made to the use of a contraceptive by a woman, this includes her partner using a contraceptive method (such as male condom).

currently using contraception over the total demand for contraception. The total demand for contraception includes women who currently have an unmet need (for spacing or limiting) plus those who are currently using contraception.

Percentage of demand for family planning satisfied with modern methods is one of the indicators used to track progress toward the Sustainable Development Goal, Target 3.7, on ensuring universal access to sexual and reproductive health-care services, including for family planning, information and education and the integration of reproductive health into national strategies and programmes. While SDG indicator 3.7.1 relates to all women age 15–49 years, it is only reported for women currently married or in union and, therefore, located in Table TM.3.3 alone.

Table TM.3.5 displays women's (of those who are married or in union) own informed decision concerning their own reproductive health. This table is generated in purpose of measuring SDG indicator 5.6.1 for Mongolia as it is not part of the standard MICS tabulation.

The indicator "Percentage of women age 15–49 years who make their own informed decisions regarding sexual relations, contraceptive use and reproductive health-care services" is calculated only for women who are currently married/in union and have used at least one contraception method in their lifetime. It is a proposed indicator for SDG Target 5.6 "Ensure universal access to sexual and reproductive health and reproductive rights as agreed in accordance with the Programme of Action of the ICPD and the Beijing Platform for Action and the outcome documents of their review conferences".

^a The category of "Don't know/Missing" in the background characteristic of "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
 (*) Figures that are based on fewer than 25 unweighted cases.

6.4 ANTENATAL CARE

The antenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. For example, antenatal care can be used to inform women and families about risks and symptoms in pregnancy and about the risks of labour and delivery, and therefore it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. Antenatal visits also provide an opportunity to supply information on birth spacing, which is recognised as an important factor in improving infant survival.

WHO recommends a minimum of eight antenatal visits based on a review of the effectiveness of different models of antenatal care.⁶ WHO guidelines are specific on the content on antenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia
- Weight/height measurement (optional).

It is of crucial importance for pregnant women to start attending antenatal care visits as early in pregnancy as possible and ideally have the first visit during the first trimester to prevent and detect pregnancy conditions that could affect both the woman and her baby. Antenatal care should continue throughout the entire pregnancy.

As specified in the national guidelines, during pregnancy, women should attend antenatal health check at least 6 times for normal pregnancy and at least 8 times for high risk pregnancy, and is instructed to attend antenatal care service within 12 weeks after becoming aware of the pregnancy.⁷ The

survey module queries whether some of the medical tests instructed in the guideline are administered:

- General blood test
- General Urinalysis
- Vaginal swab test (HVS)
- Syphilis test
- Ultrasound
- Hepatitis B, C test
- Rh Factor blood test
- Tuberculosis test

The guideline recommends use of vitamins, iron supplements, folic acid supplements for anemia prevention, hence questions covering usage of above supplements are added into the module.

Antenatal care is a tracer indicator of the Reproductive and Maternal Health Dimension of SDG 3.8 Universal Health Coverage. The type of personnel providing antenatal care to women age 15–49 years who gave birth in the two years preceding is presented in Table TM.4.1.

Table TM.4.2 shows the number of antenatal care visits during the pregnancy of their most recent birth within the two years preceding the survey, regardless of provider, by selected characteristics. Table TM.4.2 also provides information about the timing of the first antenatal care visit.

The coverage of key services that pregnant women are expected to receive during antenatal care are shown in Table TM.4.3, whereas coverage of supplementation taken during pregnancy of most recent live birth in the last 2 years is shown in Table TM.4.4.

6 WHO. WHO recommendations on antenatal care for a positive pregnancy experience. Geneva: WHO Press, 2016. <http://apps.who.int/iris/bitstream/handle/10665/250796/9789241549912-eng.pdf?sequence=1>.

¹SISS/MICS indicator TM.5a – Antenatal care coverage (at least once by skilled health personnel)

^a Only the most qualified provider is considered in cases where more than one provider was reported.

^b Skilled providers include Obstetrician, Physician, Family/soum doctor, Midwife, Auxiliary midwife and Nurse.

^c The category of "Don't know/Missing" in the background characteristic of "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

Table TM.4.2: Number of antenatal care visits and timing of first visit

Percentage of women age 15–49 years with a live birth in the last 2 years by number of antenatal care visits by any provider and percent distribution of timing of first antenatal care visit during the pregnancy of the most recent live birth, and median months pregnant at first ANC visit among women with at least one ANC visit, Mongolia, 2018

	Percentage of women by number of antenatal care visits:					Percent distribution of women by number of months pregnant at the time of first antenatal care visit								Number of women with a live birth in the last 2 years who had at least one ANC visit		
	Percentage of women by number of antenatal care visits:					Less than 4 months				8+ months						
	No visits	1–3 visits to any provider	4 or more visits to any provider ¹	6 or more visits to any provider ²	8 or more visits to any provider ³	Missing/DK	No antenatal care visits	4–5 months	6–7 months	8+ months	DK/Missing	Total	Number of women with a live birth in the last 2 years		Median months pregnant at first ANC visit

¹SISS/MICS indicator TM.9 - Skilled attendant at delivery; SDG indicator 3.1.2
²SISS/MICS indicator TM.10 - Caesarean section

^a Skilled attendants include Obstetrician, Physician, Family/soum doctor, Midwife, Auxiliary midwife, Nurse.

^b The category of "Don't know/Missing" in the background characteristic of "Place of delivery", "Functional difficulty (age 18-49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25-49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

6.5 DELIVERY CARE

Increasing the proportion of births that are delivered in health facilities is an important factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby.⁸

Table TM.6.1 presents the percent distribution of women age 15–49 who had a live birth in the two years preceding the survey by place of delivery of the most recent birth, and the percentage of their most recent births delivered in a health facility, according to background characteristics.

About three quarters of all maternal deaths occur due to direct obstetric causes.⁹ The single most critical intervention for safe motherhood is to ensure that a competent health worker with midwifery skills is present at every birth, and, in case of emergency, that there is a referral system in place to provide obstetric care in the right level of facility.⁸ The skilled attendant at delivery indicator is used to track progress toward the Sustainable Development Goal 3.1 of reducing maternal mortality and it is SDG indicator 3.1.2.

The MICS included questions to assess the proportion of births attended by a skilled attendant. According to the revised definition⁸, skilled health personnel, as referenced by SDG indicator 3.1.2, are competent maternal and newborn health professionals educated, trained and regulated to national and international standards. They are competent to: facilitate physiological processes during labour to ensure clean and safe birth; and identify and manage or refer women and/or newborns with complications.

In the Mongolian context, the MICS standard definition of skilled health personnel refers to obstetricians, physicians, family group/soum doctors, midwives, auxiliary midwife and nurses, in contrast to the national manual, in which all professionals aside from auxiliary midwife and nurses are referred to as skilled health professionals.

Table TM.6.2 presents information on assistance during delivery of the most recent birth in the two years preceding the survey. Table TM.6.2 also shows information on women who delivered by caesarean section (C–section) and provides additional information on the timing of the decision to conduct a C–section (before labour pains began or after) to better assess if such decisions are mostly driven by medical or non–medical reasons.

6.6 BIRTHWEIGHT

Weight at birth is a good indicator not only of a mother's health and nutritional status but also the newborn's chances for survival, growth, long-term health and psychosocial development. Low birth weight (LBW), defined as a birthweight less than 2,500 grams (g) regardless of gestational age, carries a range of grave health and developmental risks for children. LBW babies face a greatly increased risk of dying during their early days with more than 80% of neonatal deaths occurring in LBW newborns; recent evidence also links increased mortality risk through adolescence to LBW. For those who do survive, LBW contributes to a wide range of poor health outcomes including higher risk of stunted linear growth in childhood, and long-term effects into adulthood such as lower IQ and an increased risk of chronic conditions including obesity, diabetes and cardiovascular problems.^{10, 11}

Premature birth, being born before 37 weeks gestation, is the primary cause of LBW given that a baby born early has less time to grow and gain weight in utero, especially as much of the foetal weight is gained during the latter part of pregnancy. The other cause of LBW is intrauterine growth restriction which occurs when the foetus does not grow well because of problems with the mother's health and/or nutrition, placental problems, or birth defects. While poor dietary intake and disease during pregnancy can affect birthweight outcome, an intergenerational effect has also been noted with mothers

who were themselves LBW having an increased risk of having an LBW offspring.^{12, 13, 14} Short maternal stature and maternal thinness before pregnancy can increase risk of having an LBW child which can be offset by dietary interventions including micronutrient supplementation.^{15, 16} Other factors such as cigarette smoking during pregnancy can increase the risk of LBW, especially among certain age groups.^{17, 18}

A major limitation of monitoring LBW globally is the lack of birthweight data for many children, especially in some countries. There is a notable bias among the unweighted, with those born to poorer, less educated, rural mothers being less likely to have a birthweight when compared to their richer, urban counterparts with more highly educated mothers. As the characteristics of the unweighted are related to being LBW, LBW estimates that do not represent these children may be lower than the true value. Furthermore, poor quality of available data with regard to excessive heaping on multiples of 500 g or 100 g exists in the majority of available data from low and middle-income countries and can further bias LBW estimates.¹⁹

However, the method of estimating LBW has now been replaced with superior modelling. Currently, this new method is not ready for inclusion in the standard tabulations of MICS. Table TM.7.1 therefore only present the crude percentage, which is known to not be representative for the birthweight of all children.

^A The indicator includes children that were reported weighed at birth, but with no actual birthweight recorded or recalled.

^B The values here are as recorded on card or as reported by respondent. The total crude low birth-weight typically requires adjustment for missing birth-weights, as well as heaping, particularly at exactly 2,500 gram. The results presented here cannot be considered to represent the precise rate of low birth-weight (very likely an underestimate) and therefore not reported as a MICS indicator.

^C The category of "Don't know/Missing" in the background characteristic of "Place of delivery", "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

6.7 POST-NATAL CARE

The time of birth and immediately after is a critical window of opportunity to deliver lifesaving interventions for both the mother and newborn. Across the world, approximately 2.6 million newborns annually die in the first month of life²⁰ and the majority of these deaths occur within a day or two of birth²¹, which is also the time when the majority of maternal deaths occur²².

The Post-natal Health Checks module includes information on newborns' and mothers' contact with a provider, and specific questions on content of care. Measuring contact alone is important as Post-natal care (PNC) programmes scale up, it is vital to measure the coverage of that scale up and ensure that the platform for providing essential services is in place.

During the past 20 years, Mongolia has developed and implemented more than 10 policy initiatives for maternal and child health, postnatal healthcare service including the National Reproductive Health Programme (4 times from 1997 to 2016), Maternal Mortality Reduction Strategy (2001–2004, 2005–2010), National RH Commodity Security Strategy (2009–2013), Maternal and Newborn Health Strategy (2011–2015), Early Essential Newborn Care Strategy (2014–2020), Newborn Surveillance and Screening Programme (2014–2020).²³

Table TM.8.1 presents the percent distribution of women age 15–49 who gave birth in a health facility in the two years preceding the survey by duration of stay in the facility following the delivery, according to background characteristics.

Safe motherhood programmes recommend that all women and newborns receive a health check within two days of delivery.²⁴ To assess the extent of post-natal care utilisation, women were asked whether they and their newborn received a health check after the delivery, the timing of the first check,

and the type of health provider for the woman's most recent birth in the two years preceding the survey.

The Mongolian guideline requires newborn health checks to be conducted during the time in hospital and at least 3 times after birth, specifically: 1) within 24 hours after birth; 2) on the third day after birth; 3) on the 7th day after birth; regardless of time if necessary.²⁵

Table TM.8.2 shows the percentage of newborns born in the last two years who received health checks and post-natal care visits from any health provider after birth. Please note that health checks following birth while in facility or at home refer to checks provided by any health provider regardless of timing (column 1), whereas post-natal care visits refer to a separate visit to check on the health of the newborn and provide preventive care services and therefore do not include health checks following birth while in facility or at home. The indicator Post-natal health checks include any health check after birth received while in the health facility and at home (column 1), regardless of timing, as well as PNC visits within two days of delivery (columns 2, 3, and 4).

In Table TM.8.3, newborns who received the first PNC visit within one week of birth are distributed by location and type of provider of service. As defined above, a visit does not include a check in the facility or at home following birth.

Essential components of the content of post-natal care include, but are not limited to, thermal and cord care, breastfeeding counselling, assessing the baby's temperature, weighing the baby and counselling the mother on danger signs for newborns. Thermal care and cord care are essential elements of newborn care which contributes to keeping the baby stable and preventing hypothermia. Appropriate cord care is important for preventing life-threatening infections for both mother and baby.²⁶

National guideline on ante- post natal care instructs placing a hat on newborn babies' head. In accordance with the

23 Government resolution No.78 of 2017 on "National Programme for Maternal and Child Health"

24 PNC visits, for mothers and for babies, within two days of delivery, is a WHO recommendation that has been identified as a priority indicator for the Global Strategy for Women's, Children's and Adolescents' Health (2016–2030) and other related global monitoring frameworks like Every Newborn Action Plan and Ending Preventable Maternal Mortality.

25 The Ministry of Health of Mongolia. Ministerial order No.338. Guidelines on Ante- and Postnatal Care. Ulaanbaatar. 2014

26 WHO. WHO recommendations on Postnatal care of the mother and newborn. Geneva: WHO Press, 2013. http://apps.who.int/iris/bitstream/handle/10665/97603/9789241506649_eng.pdf?sequence=1.

guidelines, an additional question on use of hat is added to the standard MICS6 questionnaire. An additional indicator is included in this report by including the use of hat in the calculations for coverage of thermal care for newborns.

Table TM.8.4 presents the percentage of last-born children in the last 2 years who were dried after birth, percentage who were given skin to skin contact and percent distribution of timing of first bath.

Table TM.8.6 presents indicators related to the content of PNC visits, specifically the percent of most recent live births in the last two years for which, within 2 days after birth, i) the umbilical cord was examined, ii) the temperature of the newborn was assessed, iii) breastfeeding counselling was done or breastfeeding observed, iv) the newborn was weighed and v) counselling on danger signs for newborns was done.

Tables TM.8.7 and TM.8.8 present information collected on post-natal health checks and visits of the mother and are identical to Tables TM.8.2 and TM.8.3 that presented the data collected for newborns.

Table TM.8.8 matches Table TM.8.3, but now deals with PNC visits for mothers by location and type of provider. As defined above, a visit does not include a check in the facility or at home following birth.

Table TM.8.9 presents the distribution of women with a live birth in the two years preceding the survey by receipt of health checks or PNC visits within 2 days of birth for the mother and the newborn, thus combining the indicators presented in Tables TM.8.2 and TM.8.7.

¹SISS/MICS indicator TM.13 – Post-natal health check for the newborn^a Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).^b Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the newborn and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note a above).^c Post-natal health checks include any health check performed while in the health facility or at home following birth (see note A above), as well as PNC visits (see note B above) within two days of delivery.^d The category of "Don't know/Missing" in the background characteristic of "Place of delivery", "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

Table TM.8.3: Post-natal care visits for newborns within one week of birth

Percent distribution of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child received a post-natal care (PNC) visit within one week of birth, by location and provider of the first PNC visit, Mongolia, 2018

^a **SISS/MICS Indicator TM 20 – Post-natal health check for the mother**

^a Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).
^b Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the mother and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note a above).
^c Post-natal health checks include any health check performed while in the health facility or at home following birth (see note A above), as well as PNC visits (see note B above) within two days of delivery.
^d The category of "Don't know/Missing" in the background characteristic of "Place of delivery", "Functional difficulty (age 18–49 years)", and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
^e (*) Figures that are based on fewer than 25 unweighted cases.

Table TM.8.8: Post-natal care visits for mothers within one week of birth

6.8 SEXUAL BEHAVIOUR

Promoting safer sexual behaviour is critical for reducing the risk of HIV transmission. The consistent use of condoms during sex, especially when non-regular or multiple partners are involved, is particularly important for reducing the spread of HIV.^{27,28} A set of questions was administered to all women and men 15–49 years of age to assess their risk of HIV infection. Tables TM.10.1W and TM.10.1M present the percentage of women and men age 15–49 years who ever

had sex, percentage who had sex in the last 12 months, percentage who had sex with more than one partner in the last 12 months, and among those who had sex with multiple partners in the last 12 months, the percentage who used a condom at last sex.

Certain behaviour at a young age may create, increase, or perpetuate risk of exposure to HIV. Such behaviour includes sex at an early age and women having sex with older men.²⁰ Tables TM.10.2W and 10.2M show the percentage of women age 15–24 years such key sexual behaviour indicators.

27 UNAIDS et al. Fast-Tracking Combination Prevention – Towards reducing new HIV infections to fewer than 500 000 by 2020. Geneva: UNAIDS, 2015. http://www.unaids.org/sites/default/files/media_asset/20151019_JC2766_Fast-tracking_combination_prevention.pdf.

⁴ SSI/MICS indicator TM.28 – Condom use with non-regular partners

na: not applicable

⁵ The category of "Don't know/Missing" in the background characteristic of "Education", and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
 () Figures that are based on 25-49 unweighted cases.
 (*) Figures that are based on fewer than 25 unweighted cases.

6.9 HIV AND STIs

Some of the most important prerequisites for reducing the rate of HIV infection is accurate knowledge of how HIV is transmitted and strategies for preventing transmission.²⁰ Correct information is the first step towards raising awareness and giving adolescents and young people the tools to protect themselves from infection. Misconceptions about HIV are common and can confuse adolescents and young people and hinder prevention efforts.^{19,20} The UN General Assembly Special Session on HIV/AIDS (UNGASS) called on governments to improve the knowledge and skills of young people to protect themselves from HIV.^{19,20} The HIV module administered to women and men 15–49 years of age addresses part of this call.

The Global AIDS Monitoring (GAM) Reporting indicator: the percentage of young people who have comprehensive and correct knowledge of HIV prevention and transmission, is defined as 1) knowing that consistent use of a condom during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, 2) knowing that a healthy-looking person can have HIV, and 3) rejecting the two most common local misconceptions about transmission/prevention of HIV. In the SISS 2018 all women and men who have heard of AIDS were asked questions on all three components and the results are detailed in Tables TM.11.1W and TM.11.1M.

Tables TM.11.1W and TM.11.1M also present the percentage of women and men who can correctly identify misconceptions concerning HIV. The indicator is based on the two most common and relevant misconceptions in Mongolia, that HIV can be transmitted by mosquito bites or sharing food and drinks with person who have HIV. The tables also provide information on whether women and men know that HIV cannot be transmitted by the mosquito bites or sharing food and drinks.

Knowledge of mother-to-child transmission of HIV is also an important first step for women to seek HIV testing when they are pregnant to avoid infection in the baby. Women and men should know that HIV can be transmitted during pregnancy, during delivery, and through breastfeeding. The level of knowledge among women and men age 15–49 years concerning mother-to-child transmission is presented in Tables TM.11.2W and TM.11.2M.

Discrimination is a human rights violation prohibited by international human rights law and most national constitutions. Discrimination in the context of HIV refers

to unfair or unjust treatment (an act or an omission) of an individual based on his or her real or perceived HIV status. Discrimination exacerbates risks and deprives people of their rights and entitlements, fuelling the HIV epidemic.²⁰

The following questions were asked in SISS 2018 to measure stigma and discriminatory attitudes that may result in discriminatory acts (or omissions): whether the respondent 1) would buy fresh vegetables from a shopkeeper or vendor who has HIV; 2) thinks that children living with HIV should be allowed to attend school with children who do not have HIV; 3) thinks people hesitate to take an HIV test because they are afraid of how other people will react if the test result is positive for HIV; 4) thinks people talk badly about those living with HIV, or who are thought to be living with HIV; 5) thinks people living with HIV, or thought to be living with HIV, lose the respect of other people; 6) agrees or disagrees with the statement 'I would be ashamed if someone in my family had HIV'; and 7) fears that she/he could get HIV if she/he comes into contact with the saliva of a person living with HIV. Tables TM.11.3W and TM.11.3M present the attitudes of women and men towards people living with HIV.

Another important indicator is the knowledge of where to be tested for HIV and use of such services. In order to protect themselves and to prevent infecting others, it is important for individuals to know their HIV status. Knowledge of own status is also a critical factor in the decision to seek treatment.^{19,20} Questions related to knowledge of a facility for HIV testing and whether a person has ever been tested are presented in Tables TM.11.4W and TM.11.4M.

Among women who had given birth within the two years preceding the survey, the percentage who received counselling and HIV testing during antenatal care is presented in Table TM.11.5. This indicator is used to track progress towards global and national goals to eliminate mother-to-child transmission of HIV. High coverage enables early initiation of care and treatment for HIV positive mothers required to live healthy and productive lives

In many countries, over half of new adult HIV infections are among young people age 15–24 years thus a change in behaviour among members of this age group is especially important to reduce new infections.^{19,20} The next tables present specific information on this age group. Tables TM.11.6W and TM.11.6M summarise information on key HIV indicators for young women and young men.

In the SISS 2018, few questions are added from Demographic Health Survey (DHS) standard questionnaire to collect

data on sexually transmitted infections (STI), that are not part of the MICS6 standard. These questions are directed for inferring STI symptoms within the past 12 months: 1) Sometimes genital odor or an abnormal discharge may occur. In the past 12 months, did you have such symptoms? 2) Sometimes genital blisters, ulcers or verruca may occur. In the past 12 months, did you have such symptoms? Also

additional questions asking whether the respondent has been ever tested for STI and in the past 12 months were included.

Tables TM.11.7W and TM.11.7M shows the percentage of women and men who reported symptoms or having STI, and tested for STI in the past 12 months before the survey.

Table TM.11.1W: Knowledge about HIV transmission, misconceptions about HIV, and comprehensive knowledge about HIV transmission (women)

Percentage of women age 15–49 years who know the main ways of preventing HIV transmission, percentage who know that a healthy-looking person can be HIV-positive, percentage who reject common misconceptions, and percentage who have comprehensive knowledge about HIV transmission, Mongolia, 2018

	Percentage who know transmission can be prevented by:				Percentage who know that HIV cannot be transmitted by ^a :			Percentage who reject the two most common misconceptions and know that a healthy-looking person can be HIV-positive	Percentage with comprehensive knowledge ^b	Number of women	
	Percentage who have heard of AIDS	Having only one faithful/uninfected sex partner		Using a condom every time	Both	Percentage who know that a healthy-looking person can be HIV-positive	Sharing food with someone with HIV

^aSSSMICS indicator TM.29 – Knowledge about HIV prevention among young people

^b Means of HIV transmission determining comprehensive knowledge about HIV prevention among young people comprise of the questions of mosquito bites, sharing food with someone with HIV and superstition in accordance with the MIC56 standards. However, the means of superstition was excluded from the questionnaires since its concept did not suit in the Mongolian context.

^c Comprehensive knowledge about HIV prevention includes those who know of the two ways of HIV prevention (having only one faithful/uninfected partner and using a condom every time), who know that a healthy-looking person can be HIV-positive and who reject the two most common misconceptions about HIV transmission.

^d The category of "Don't know/Missing" in the background characteristic of "Marital status", "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

Table TM. 11. 1M: Knowledge about HIV transmission, misconceptions about HIV, and comprehensive knowledge about HIV transmission (men)

Percentage of men age 15–49 years who know the main ways of preventing HIV transmission, percentage who know that a healthy-looking person can be HIV-positive, percentage who reject common misconceptions, and percentage who have comprehensive knowledge about HIV transmission, Mongolia, 2018

6.10 MALE CIRCUMCISION

Evidence has shown that male circumcision (the complete removal of the foreskin of the penis) reduces the risk of heterosexually acquired HIV infection in men by approximately 60 percent and is safe when performed by well-trained health professionals in properly equipped settings.²⁹ In countries and regions with heterosexual epidemics and high HIV and low male circumcision prevalence, male circumcision is being included in comprehensive HIV prevention packages.²⁰ Alone, male circumcision is only partially protective, however, when combined with HIV testing and counselling

services, condoms, safer sexual practices and treatment of sexually transmitted infections, it is highly effective.^{19,20} It may already be performed for religious, medical, or cultural reasons and can be carried out at birth, during adolescence, or at other times during a man's life.

In Mongolia, male circumcision is common only for people of Kazakh ethnicity as part of their tradition.

The prevalence of male circumcision is presented in Table TM.12.1, which also shows the age of circumcision while Table TM.12.2 shows the provider and place where circumcision was performed.

²⁹ Bailey, R. et al. "Male Circumcision for HIV Prevention in Young Men in Kisumu, Kenya: A Randomised Controlled Trial." *The Lancet* 369, no. 9562 (2007): 643–56. doi:10.1016/S0140–6736(07)60312–2.

6.11 CERVICAL CANCER³⁰

There were estimated 569,847 new cases of cervical cancer and 311,365 cervical cancer deaths globally in 2018³¹. In Mongolia during 2008–2017, on average annually, there were over 400 new cases and over 140 deaths. Cervical cancer is the second most common cause of cancer related deaths among Mongolian women³².

Cervical cancer can be cured if diagnosed early. In 2012, with the support of the Health Project of the Millennium Challenge Account initiative, the cervical and breast cancer screening were introduced. Moreover, cervical cancer is caused by human papilloma virus infection and can be prevented by a vaccine.

Table TM.13.1 shows the percentage of women who have knowledge of (have heard or read about) cervical cancer and percentage of women who had regular cervical cancer screening, with percentage distribution by place of screening.

Meanwhile, Table TM.13.2. shows the percentage of women who did not have regular screening with percentage distribution by reasons of not having cervical cancer screening.

Table TM.13.3 shows the percentage of women age 20–49 years who heard about human papilloma virus and stated that the vaccination against human papilloma virus should be taken by girls and percentage of women age 15–29 years who were vaccinated against the virus.

6.12 PREGNANCY OUTCOME AND ABORTION³³

When women want to cease or space childbearing and do not use contraception or use it ineffectively or experience non-consensual sex, unintended pregnancies occur: some are terminated by induced abortions while others result in unwanted births. Where abortion laws are restricted or safe abortion services are not widely accessible or are of poor quality, women may attempt to self-induce an abortion or resort to unskilled providers, risking serious consequences to their health and well-being.³⁴

Most women who have an abortion do so because they become pregnant when they do not intend to. In developing countries, 84 per cent of unintended pregnancies occur among women who have an unmet need for modern contraception. Thus, the magnitude of induced abortion is the important indicator of the effectiveness of both the supply and demand sides of the family planning programmes.³⁵

Mongolia is one of the countries that legalized abortion in 1989³⁶. The country aims at decreasing abortion rate per 1,000 live births from 224 to 200 between 2016 and 2020, as indicated in the National Maternal and Child Health Programme 2017–2021.³⁷

Therefore, this chapter has been added to MICS standard survey tools as a survey subject that is specific to Mongolia, and the following indicators are analyzed: 1) Pregnancy outcome; 2) Frequency of induced abortion; 3) Magnitude of induced abortion expressed by rate and ratio; 4) Methods of abortion; 5) Timing of the gestational age at the time of abortion; 6) Health care providers of induced abortion; and, 7) The place where induced abortion occurred.

The magnitude of induced abortion is estimated for all pregnancies – each pregnancy of woman during the period is accounted for – abortion methods and indicators are then estimated for the last abortion in the 2 years preceding the survey.

Table TM.14.1 displays the percentage of pregnant women and percent distribution of women for whom the conception terminated during the pregnancy in the last 2 years by the outcome of pregnancy.

Percentage distribution of women age 15–49 years whose pregnancy ended with an induced abortion in the last 2 years by number of times of abortion is shown in Table TM.14.2.

Total abortion rates within 2 years preceding the survey is displayed in Table TM.14.3 as Table TM.14.4 shows the total abortion rates disaggregated by background characteristics while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. Estimates for induced abortion in urban and rural areas are made in the following rates:

- Age-specific abortion rates (ASARs), expressed as the number of induced abortion per 1,000 women in a specified age group, show the age pattern of abortion. Numerators for ASARs are calculated by identifying live induced abortion that occurred in the two-year period preceding the survey, classified according to the age of the women (in five-year age groups) at the time of the abortion. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The total abortion rate (TAR) is a synthetic measure that denotes the number of induced abortions a woman would have if she were subject to the current age-specific abortion rates throughout her reproductive years (15–49 years).
- The general abortion rate (GAR) is the number of induced abortions occurring during the specified period per 1,000 women age 15–49.
- The abortion ratio (AR) is the number of induced abortions per 1,000 live births during the specified period.

Table TM.14.5 displays the percentage of women who had an induced abortion by abortion methods. Table TM.14.6 shows the percent distribution of whom by duration of pregnancy before abortion.

Additionally, Tables TM.14.7 and TM.14.8 shows the percentage of women who had an abortion within 2 years of the survey with percentage distribution by its type of attendant and places respectively.

(*) Figures that are based on fewer than 25 unweighted cases.

CHILD HEALTH, NUTRITION AND DEVELOPMENT

7.1 IMMUNISATION

Immunisation is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert between 2 and 3 million deaths each year.¹ It is one of the most cost-effective health investments, with proven strategies that make it accessible to even the most hard-to-reach and vulnerable populations.

The WHO Recommended Routine Immunisations for Children² recommends all children to be vaccinated against tuberculosis, diphtheria, tetanus, pertussis, polio, measles, hepatitis B, haemophilus influenzae type b, pneumococcal bacteria/disease, rotavirus, and rubella.³

At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The proportions of the target population covered by DTP, pneumococcal (conjugate) and measles are presented in Table TC.1.1.

All doses in the primary series are recommended to be completed before the child's first birthday, although depending on the epidemiology of disease in a country, the first doses of measles and rubella containing vaccines may be recommended at 12 months or later. The recommended number and timing of most other doses also vary slightly with local epidemiology and may include booster doses later in childhood.

The vaccination schedule followed by the Mongolia National Immunisation Programme provides most of the above

mentioned vaccinations with birth doses of BCG, Polio, and Hepatitis B vaccines (within 24 hours of birth), three doses of the Pentavalent vaccine containing diphtheria, pertussis and tetanus (DPT), Hepatitis B, and Haemophilus influenzae type b (Hib) antigens, three doses of Polio vaccine, two doses of the MMR vaccine containing measles, mumps, and rubella antigens at 9 and 24 months, and, in addition, two dose of vaccine against Hepatitis A. All vaccinations should be received during the first year of life except the second dose of MMR at 24 months and two doses of Hepatitis A at 14 and 24 months. Taking into consideration this vaccination schedule, the estimates for full immunisation coverage from the SISS, 2018 are based on children age 12–23/24–35 months, and for children 30–35 months with MMR2 and Hepatitis A2.

Information on vaccination coverage was collected for all children under three years of age. All mothers or caretakers were asked to provide a Mother and child health book. In few occasions, a vaccination card was provided in addition to the book. If the health book/vaccination card for a child was available, interviewers copied vaccination information from the health book/vaccination card onto the SISS questionnaire. If no health book/vaccination card was available for the child, the interviewer proceeded to ask the mother to recall whether the child had received each of the vaccinations, and, for applicable antigens, how many doses were received. Information was also obtained from vaccination records at health facilities for all children irrespective of the health book/vaccination card was or was not provided to the interviewers

1 "Immunization Highlights 2015." World Health Organization. June 27, 2016. Accessed August 23, 2018. <http://www.who.int/immunization/highlights/2015/en/>.

2 "WHO Recommendations for Routine Immunization – Summary Tables." World Health Organization. August 22, 2018. Accessed August 23, 2018. http://www.who.int/immunization/policy/immunization_tables/en/.

3 Additionally, vaccination against the human papillomavirus (HPV) is recommended for girls from 9 to 14 years of age², but coverage of this vaccine is not yet included in MICS, as methodology is under development.

at home. The final vaccination coverage estimates are based on information obtained from all of the three sources – the health book/vaccination card, the mother’s report and the health facility records. Any record was acceptable in the tabulation, i.e., if facility records did not show, for instance, BCG, a positive recall by the mother included BCG in the tabulation. However, the proportion of cases by the mother’s report presented in a separate column whereas the health book/vaccination card and health facility records were incorporated onto another individual column in the tabulation. In the latter occasion, the hierarchy of presentation preferred the facility record, e.g., if BCG is recorded both on health

book/vaccination card and in facility, the tabulation included it as recorded at facility.

Table TC.1.2 presents vaccination coverage estimates among children age 12–23/24–35 months, and 30–35 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey, and are based on information from both the books/vaccination cards or health facility records and mothers’/ caretakers’ reports.

Table TC.1.2: Vaccinations by background characteristics

Percentage of children age 12–23, 24–35 and 30–35 months currently vaccinated against vaccine preventable childhood diseases (Crude coverage), Mongolia, 2018

^aBasic antigens include: BCG, Polio1–3, Penta1–3, MMR1.

^bIncludes children for whom vaccination cards or other documents were observed with at least one vaccination dose recorded (Card availability).

^cAll antigens include: BCG, Polio1–3, Penta1–3, HepA1–2 and MMR2 as per the vaccination schedule in Mongolia.

^dThe category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

7.2 DISEASE EPISODES

A key strategy for achieving progress toward SDG 3.2: By 2030, end preventable deaths of newborns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea and pneumonia which are still among the leading killers of children under 5.⁴

Table TC.2.1 presents the percentage of children under 5 years of age who were reported to have had an episode of diarrhoea, symptoms of acute respiratory infection (ARI) or fever during the 2 weeks preceding the survey. These results are not measuring of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

The definition of a case of diarrhoea or fever, in this survey, was the mother's (or caretaker's) report that the child had such symptoms over the specified period; no other evidence

was sought beside the opinion of the mother. A child was considered to have had symptoms of ARI if the mother or caretaker reported that the child had, over the specified period, an illness with a cough with rapid or difficult breathing, and whose symptoms were perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose. While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, diarrhoea, fever and ARI are not only seasonal but are also characterized by the often-rapid spread of localized outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

4 The main killers of children under age 5 in 2016 included preterm birth complications (18 per cent), pneumonia (16 per cent), intrapartum related events (12 per cent), diarrhoea (8 per cent) and neonatal sepsis (7 per cent). UNICEF et al. Levels and Trends in Child Mortality Report 2017. New York: UNICEF, 2017. https://www.unicef.org/publications/index_101071.html.

7.3 DIARRHOEA

Diarrhoea is one of the leading causes of death among children under five worldwide.⁵ Most diarrhoea-related deaths in children are due to dehydration from loss of large quantities of water and electrolytes from the body in liquid stools. Management of diarrhoea – either through oral rehydration salt solution (ORS) or a recommended homemade fluid (RHF) – can prevent many of these deaths.⁶ In addition, provision of zinc supplements has been shown to reduce the duration and severity of the illness as well as the risk of future episodes within the next two or three months.

Almost 60 per cent of deaths due to diarrhoea worldwide are attributable to unsafe drinking water and poor hygiene and sanitation. Hand washing with soap alone can cut the risk of diarrhoea by at least 40 per cent and significantly lower the risk of respiratory infections. Clean home environments and good hygiene are important for preventing the spread of both pneumonia and diarrhoea, and safe drinking water and proper disposal of human waste, including child faeces, are vital to stopping the spread of diarrhoeal disease among children and adults.²

In the SISS, mothers or caretakers were asked whether their child under age five years had an episode of diarrhoea in the two weeks prior to the survey. In cases where mothers

reported that the child had diarrhoea, a series of questions were asked about the treatment of the illness, including what the child had been given to drink and eat during the episode and whether this was more or less than what was usually given to the child.

Table TC.3.1 shows the percentage of children age 0–59 months with diarrhoea in the two weeks preceding the survey for whom advice or treatment was sought and where.

Table TC.3.2 shows patterns on drinking and feeding practices during diarrhoea among children age 0–59 months.

Table TC.3.3 shows the percentage of children age 0–59 months receiving ORS, various types of recommended homemade fluids and zinc during the episode of diarrhoea. Since children may have been given more than one type of liquid, the percentages do not necessarily add to 100.

Table TC.3.4 provides the proportion of children age 0–59 months with diarrhoea in the last two weeks who received oral rehydration therapy with continued feeding, and the percentage of children with diarrhoea who received other treatments.

Table TC.3.5 provides information on the source of ORS and zinc for children age 0–59 months who received these treatments.

5 UNICEF. One is Too Many: Ending Child Deaths from Pneumonia and Diarrhoea. New York: UNICEF, 2016. <https://data.unicef.org/wp-content/uploads/2016/11/UNICEF-Pneumonia-Diarrhoea-report2016-web-version.pdf>.

6 In 2004, UNICEF and WHO published a joint statement with diarrhoea treatment recommendations for low-income countries, which promotes low-osmolarity rehydration salts (ORS) and zinc, in addition to continued feeding: WHO, and UNICEF. Clinical Management of Acute Diarrhoea. Joint Statement, New York: UNICEF, 2004. https://www.unicef.org/publications/files/ENAcute_Diarrhoea_reprint.pdf.

^a Includes all public and private health facilities and providers, as well as those who did not know if public or private.

(*) Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

– Zero unweighted cases to base a percent.

7.4 HOUSEHOLD ENERGY USE

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the Sustainable Development Goals seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2030 and would be measured as the percentage of the population relying on clean fuels and technology.⁷

The SISS, 2018 included a module with questions to assess the main technologies and fuels used for cooking, heating, and lighting. Information was not collected about the use of technologies with chimneys or other venting mechanisms as this is not applicable in the Mongolian context.

Households that use clean fuels and technologies for cooking are those mainly using electric stove or LPG (Liquefied Petroleum Gas)/cooking gas stove. Table TC.4.1 presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table TC.4.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for

cooking while Table TC.4.3 presents the percent distribution of household members in households using polluted fuels for cooking by type and characteristics of cookstove and by place of cooking.

Households that use clean fuels and technologies for space heating are those mainly relying on central heating or using solar air heater operated by renewable energy or electricity. Table TC.4.4 presents the percent distribution of household members according to type of fuel mainly used for space heating by the household, and percentage of household members living in households using clean fuels and technologies for space heating.

Households that use clean fuels and technologies for lighting are those mainly using electricity, solar lantern, rechargeable or battery powered flashlight, torch or lantern. Gasoline/diesel generators are included in the electricity since they generate and distribute it to home. Table TC.4.6 presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking, space heating and lighting help to monitor SDG indicator 7.1.2, “Proportion of population with primary reliance on clean fuels and technology” for cooking, space heating and lighting. Table TC.4.7 presents the percentage of household members living in households using clean fuels and technologies for cooking, space heating, and lighting.

7 WHO. Burning Opportunity: Clean Household Energy for Health, Sustainable Development, and Wellbeing of Women and Children. Geneva: WHO Press, 2016. http://apps.who.int/iris/bitstream/handle/10665/204717/9789241565233_eng.pdf;jsessionid=63CEC48ED96098D4256007A76FEB8907?sequence=1.

Table TC.4.1: Primary reliance on clean fuels and technologies for cooking

	Percentage of household members in households with primary reliance on:										Number of household members (living in households that reported cooking)
	Clean fuels and technologies for cooking and using					Other fuels for cooking and using					
	Electric stove	Liquefied Petroleum Gas (LPG) / Cooking gas stove	Manufactured solid fuel stove	Traditional solid fuel stove	Three stone stove / Open fire	Other cookstove	No food cooked in the household	Total	Number of household members	Primary reliance on clean fuels and technologies for cooking (in households that reported cooking) ¹

¹SISS/MICS indicator TC.18 – Primary reliance on clean fuels and technologies for cooking, space heating, and lighting; SDG Indicator 7.1.2

^AIn order to be able to calculate the indicator, household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator.

7.5 SYMPTOMS OF ACUTE RESPIRATORY INFECTION

Symptoms of ARI are collected during the SISS, 2018 to capture symptoms related to pneumonia, a leading cause of death in children under five.² Once diagnosed, pneumonia is treated effectively with antibiotics. Studies have shown a limitation in the survey approach of measuring pneumonia because many of the cases reported in surveys by the mothers or caretakers with symptoms of pneumonia are in fact, not true pneumonia.⁸ While this limitation does not affect the level and patterns of care-seeking for symptoms

of ARI, it limits the validity of the level of treatment of ARI with antibiotics, as reported through household surveys. The treatment indicator described in this report must therefore be taken with caution.

Table TC.5.1 presents the percentage of children with symptoms of ARI, which is also generally referred to as symptoms of pneumonia, in the two weeks preceding the survey for whom care was sought, by source of care and the percentage who received antibiotics. Information is also presented by sex, age, region, area, age, and socioeconomic factors and the point of treatment among children with symptoms of ARI who were treated with antibiotics.

8 Campbell, H. et al. "Measuring Coverage in MNCH: Challenges in Monitoring the Proportion of Young Children with Pneumonia Who Receive Antibiotic Treatment." PLoS Med 10, no.5 (2013). doi:10.1371/journal.pmed.1001421

Table TC.5.1: Care-seeking for and antibiotic treatment of symptoms of acute respiratory infection (ARI)

Percentage of children age 0–59 months with symptoms of ARI in the last two weeks for whom advice or treatment was sought, by source of advice or treatment, and percentage of children with symptoms who were given antibiotics, Mongolia, 2018

	Percentage of children with symptoms of ARI for whom:				Number of children with symptoms of ARI in the last two weeks	Percentage of children with symptoms of ARI for whom the source of antibiotics was:			Number of children with symptoms of ARI in the last two weeks who were given antibiotics

²SISS/MICS indicator TC.20 – Antibiotic treatment for children with ARI symptoms

^a Includes all public and private health facilities and providers, as well as those who did not know if public or private.

^b Includes all public and private health facilities and providers, as well as those who did not know if public or private.

^c The category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

(*) Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

7.6 INFANT AND YOUNG CHILD FEEDING

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe.⁹ Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon.¹⁰ Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the

home due to food adulteration or other contamination that can affect unaware consumers.¹¹ As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.¹²

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.¹³ Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from food consistency to responsive feeding.^{14,15} The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators^{16,17} have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ guiding principle	Indicators /proximate measures ¹⁸	Notes on interpretation ¹⁹	Table
Breastfeed within one hour of birth	Early Initiation of breastfeeding Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	This is the only indicator in the series based on historical recall, that is, of what happened up to 2 years before the survey interview.	TC 7.1
Breastfeed exclusively for the first six months of life	Exclusive breastfeeding under 6 months Percentage of infants under 6 months of age who are exclusively breastfed ²⁰	Captures the desired practice for the entire population of interest (i.e. all children age 0–5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC.7.3
Introduce solid, semi-solid and soft foods at the age of 6 months	Introduction of solid, semi-solid or soft foods (age 6–8 months) Percentage of infants age 6–8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e. all children age 6–8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6–8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC 7.6
Continue frequent, on-demand breastfeeding for two years and beyond	Continued breastfeeding at 1 year and 2 years Percentage of children age 12–15 months (1 year) and 20–23 months (2 years) who received breast milk during the previous day	Captures the desired practice for different populations of interest (children should be breastfed for up to 2 years) in a 24-hour period. However, the label of 1 and 2 years can be confusing given the actual age range in months for each indicator.	TC.7.3
Provide meals with appropriate frequency and energy density	Minimum meal frequency (age 6–23 months) Breastfed children: Depending on age, at least two or three meals/snacks provided during the previous day Non-breastfed children: At least four meals/snacks and/or milk feeds provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide foods with appropriate nutrient content	Minimum dietary diversity (age 6–23 months) At least five of eight food groups ²¹ consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to “count” as the standard indicator is only meant to capture yes/no responses. Rates should not be compared between breastfed and non-breastfed children.	TC.7.7
Provide an appropriate amount of food	No standard indicator exists		na

18 It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

19 For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

20 Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

21 The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

Recommendation/ guiding principle	Indicators /proximate measures ¹⁸	Notes on interpretation ¹⁹	Table
Provide food with appropriate consistency	No standard indicator exists		na
Use of vitamin–mineral supplements or fortified products	No standard indicator exists		na
Safe preparation and storage of foods	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.8
Responsive feeding	No standard indicator exists		na

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of “minimum acceptable diet”. This indicator assesses energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

- (i) The appropriate number of meals/snacks/milk feeds;
- (ii) Food items from at least 5 out of 8 food groups for breastfed children; and 4 out of 7²² food groups for non-breastfed children; and
- (iii) At least two milk feeds for non-breastfed children.

Table TC.7.1 is based on mothers' reports of when their last-born child, born in the last two years, was first put to the breast. It indicates the proportion who were ever breastfed, as well as those who were first breastfed within one hour and one day of birth.

Table TC.7.2 presents information about liquids or other items newborns were given in the first 3 days of life, apart from breastmilk. The data are disaggregated by various background characteristics, including whether the child was ever breastfed or not.

The set of infant and young child feeding indicators reported in tables TC.7.3 through TC.7.6 are based on the mother's report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent's ability to provide a full report on the child's liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.3, breastfeeding status is presented for exclusively breastfed infants age 0–5 months (i.e. those who

receive only breastmilk) and predominantly breastfed infants age 0–5 months (i.e. those who receive breastmilk in addition to plain water and/or non-milk liquids). The table also shows continued breastfeeding of children age 12–15 months and age 20–23 months.

Table TC.7.4 shows the median duration of any breastfeeding among children age 0–35 months and the median duration of exclusive breastfeeding and predominant breastfeeding among children age 0–23 months.

The age-appropriateness of breastfeeding practices for children under the age of 24 months is provided in Table TC.7.5. Different feeding criteria are used depending on the age of the child. For infants age 0–5 months, exclusive breastfeeding is considered age-appropriate feeding, while children age 6–23 months are considered appropriately fed if they are receiving breastmilk and solid, semi-solid or soft foods.

Table TC.7.6 further looks into the introduction of solid, semi-solid, or soft foods for infants age 6–8 months, while Table TC.7.7 presents the percentage of children age 6–23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children), by breastfeeding status.

The continued practice of bottle-feeding is a concern because of the potential for contamination if the bottle and/or nipple are not properly cleaned or sterilized. Bottle-feeding can also hinder breastfeeding due to nipple confusion, especially at the youngest ages.²³ Table TC.7.8 presents the percentage of children aged 0–23 months who were bottle-fed with a nipple during the previous day.

22 Note that the denominator becomes 7 food groups for non-breastfed children in the composite indicator as the milk products group is removed from diet diversity, as this is assessed separately.

23 Zimmerman, E. and K. Thompson. “Clarifying Nipple confusion.” *J Perinatol* 35, no.11 (2015):895–9. doi: 10.1038/jp.2015.83.

Table TC.7.1: Initial breastfeeding

Percentage of most recent live-born children to women age 15–49 years with a live birth in the last two years who were ever breastfed, breastfed within one hour of birth and within one day of birth, Mongolia, 2018

^a Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

^b Minimum meal frequency among currently breastfeeding children is defined as children who also received solid, semi-solid, or soft foods 2 times or more daily for children age 6–8 months and 3 times or more daily for children age 9–23 months. For non-breastfeeding children age 6–23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times.

^c The minimum acceptable diet for breastfed children age 6–23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings and that the minimum dietary diversity is achieved without counting milk feeds.

^d The category of "Don't know/Missing" in the background characteristic of "Mother's functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

(*) Figures that are based on 25–49 unweighted cases.

7.7 MALNUTRITION

Children's nutritional status reflects their overall health. When children have access to an adequate food supply, are not exposed to repeated illness, and are well cared for, they reach their growth potential and are considered well-nourished.

Undernutrition is associated with nearly half of all child deaths worldwide.²⁴ Children suffering from undernutrition are more likely to die from common childhood ailments, and those who survive often suffer recurring sicknesses and faltering growth. Three-quarters of children who die from causes related to undernutrition only had mild or moderate forms of undernutrition, meaning they showed little outward sign of their vulnerability.²⁵ The Sustainable Development Goal target 2.2 is to reduce the prevalence of stunting among children under five by 40 per cent between 2012 and 2025 as well as to reduce wasting to <5 per cent and have no increase in overweight over the same period. A reduction in the prevalence of malnutrition will also contribute to the achievement of several other global goals, including the goal to end preventable newborn and child deaths.

In a well-nourished population, there is a reference distribution of height and weight for how children under 5 should grow. The reference population used in this report is based on the WHO growth standards.²⁶ Undernutrition in a population can be gauged by comparing children to this reference population. Each of the three nutritional status indicators – weight-for-age, height-for-age, and weight-for-height – can be expressed in standard deviation units (z-scores) from the median of the reference population.

Weight-for-age is a measure of both acute and chronic malnutrition. Children whose weight-for-age is more than two standard deviations below the median of the reference population are considered moderately or severely underweight, while those whose weight-for-age is more than three standard deviations below the median are classified as severely underweight.

Height-for-age is a measure of linear growth. Children whose height-for-age is more than two standard deviations below the median of the reference population are considered

short for their age and are classified as moderately or severely stunted. Those whose height-for-age is more than three standard deviations below the median are classified as severely stunted. Stunting, or chronic malnutrition, is the result of failure to receive adequate nutrition in early life over an extended period and/or recurrent or chronic illness.

Weight-for-height can be used to assess wasting and overweight status. Children whose weight-for-height is more than two standard deviations below the median of the reference population are classified as moderately or severely wasted, while those who fall more than three standard deviations below the median are classified as severely wasted. Wasting is usually the result of poor nutrient intake or disease. The prevalence of wasting may shift seasonally in response to changes in the availability of food and/or disease prevalence.

Children whose weight-for-height is more than two standard deviations above the median reference population are classified as moderately or severely overweight.

In SISS, weights and heights of all children under 5 years of age were measured using the anthropometric equipment recommended by UNICEF.²⁷ Findings in this section are based on the results of these measurements in conjunction with the age in months data based on birth dates collected during the survey interview.

Table TC.8.1 shows percentages of children classified into each of the above described categories, based on the anthropometric measurements that were taken during fieldwork. Additionally, the table includes mean z-scores for all three anthropometric indicators.

Children whose full birth date (month and year) were not obtained (normally this has not been the case in SISSs and see DQ.2.4 for birth data and age reporting in the data quality tables), and children whose measurements were not taken due to absence from the home during interviews or other reasons, or whose measurements are outside a plausible range are excluded from Table TC.8.1. Children are excluded from one or more of the anthropometric indicators when their weights and heights have not been measured, or their age is

not available, whichever applicable. For example, if a child has been weighed but his/her height has not been measured, the child is included in underweight calculations, but not in the calculations for stunting and wasting. Percentages of children by age and reasons for exclusion are shown in the data quality tables DQ.3.4, DQ.3.5, and DQ.3.6 in Appendix D. The tables show that due to implausible measurements, and/or missing weight and/or height, 2.2 percent of children have been excluded from calculations of the weight-for-age indicator, 2.9 percent from the height-for-age indicator, and

3.4 percent for the weight-for-height indicator. Table DQ.3.7 depicts possible digit preference in measurements of the anthropometry. In some cases, measurers tend to record the final digit of the decimals rounding to 0 or 5 for ease. If this is the case, the percentage distribution of every decimal digit is likely to bias than the expected distribution of around 10 percent of each digit. For the weight measurements, such digit preference was hardly observed whereas rounding to 0 appeared with 16.4 percent and avoiding from 9 with 6.4 percent in the height measurements.

Table TC.8.1: Nutritional status of children

7.8 SALT IODISATION

Iodine Deficiency Disorders (IDD) are the world's leading cause of preventable brain damage and impaired psychomotor development in young children.²⁸ In its most extreme form, iodine deficiency causes cretinism. It also increases the risks of stillbirth and miscarriage in pregnant women. Iodine deficiency is most commonly and visibly associated with goitre. IDD takes its greatest toll in impaired mental growth and development, contributing to poor learning outcomes, reduced intellectual ability, and impaired work performance.²⁹ The indicator reported in SISS is the percentage of households consuming iodized salt as assessed using rapid test kits.

An IDD survey was launched with the assistance of UNICEF primarily to determine the level of national IDD prevalence in 1992–1995. The findings indicated IDD prevalence has been alarmingly high in some regions of the country.³⁰ Accordingly, the Government of Mongolia developed and implemented the first “National Programme on combating IDD”, starting from 1996 to 2001. Since then, the Government approved and implemented the second and the third stages of this programme during 2002–2006 and 2007–2010.

Under the framework of the National programme, the Government of Mongolia implemented various activities

such as improving the legal environment for the iodized salt production and support of its consumption; raising public awareness about the IDD, iodized salt and its benefits, and other actions, directed towards establishing the attitudes and practices of iodized salt consumption.

“The National Standards for edible, Iodized Salt (MNS 5046:2001)”, the Law of Mongolia on “Salt iodization and prevention from iodine deficiency” (2003), and the Regulations on “Control of fortified food products” (2006) were adopted under which legalized the mandatory salt iodization. Starting with the launching of “Combating IDD program” in 1996, iodized salt has been introduced into food consumption of the population. According to the National Standards, only potassium iodate is allowed for all type of edible salt iodization. However, there is a lack of control for the presence of iodine in the imported salt. In 2018, Parliament of Mongolia adopted a new law on “Fortified foods”, which will be in effect at the end of 2019. Salt iodization activities will be reinforced under the framework of this new law.

In SISS, 2018, salt used for cooking in the household was tested for presence of iodine using rapid test kits for both potassium iodide and potassium iodate. Table TC.9.1 presents the percent distribution of households by consumption of iodized salt.

7.9 EARLY CHILDHOOD DEVELOPMENT

It is well recognized that a period of rapid brain development occurs in the first years of life, and the quality of children's home environment and their interactions with caregivers is a major determinant of their development during this period.³¹ Children's early experiences with responsive caregiving serves an important neurological function and these interactions can boost cognitive, physical, social and emotional development.³² In this context, engagement of adults in activities with children, presence of books and playthings in the home for the child, and the conditions of care are important indicators.

Information on a number of activities that provide children with early stimulation and responsive care was collected in the survey and presented in Table TC.10.1. These included the involvement of adults in the household with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things.

Exposure to books in early years not only provides children with greater understanding of the nature of print, but may also give them opportunities to see others reading, such as older siblings doing school work. Presence of books is important for later school performance. The potential effects of mobile technology, typically smartphones and tablets, has been raising questions on how they can affect childhood physical, cognitive, emotional, and social wellbeing. However, gathered evidence is inconsistent and unclear, dividing the findings into negative or positive conclusions due to their relative novelty³³. The mothers/caretakers of all children under 5 were asked about the number of children's books or picture books they have for the child, the types of playthings that are available at home, and whether they allow the child play with smartphones. The findings are presented in Table TC.10.2.

Some research has found that leaving children without adequate supervision is a risk factor for unintentional injuries.³⁴ In SISS, two questions were asked to find out whether children age 0–59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. This is presented in Table TC.10.3.

7.10 EARLY CHILD DEVELOPMENT INDEX

Early childhood development is multidimensional and involves an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities across the first few years of life.³⁵ Physical growth, literacy and numeracy skills, socio-emotional development and readiness to learn are vital domains of a child's overall development, which build the foundation for later life and set the trajectory for health, learning and well-being.³⁶

A 14-item module was used to calculate the Early Child Development Index (ECDI) in two separate approaches. Among items, 10 questions were used for the calculation of the ECDI as proposed by the MICS standard guidance. The rest of 4 questions were for the ECDI as indicated in the Pre-school education standard of Mongolia. The primary purpose of the ECDIs is to inform public policy regarding the developmental status of children in Mongolia with both standards. The indexes are based on selected milestones that children are expected to achieve by ages 3 and 4. The MICS standard 10 items are used to determine if children are developmentally on track in four domains:

- Literacy- numeracy: Children are identified as being developmentally on track based on whether they can identify/name at least ten letters of the alphabet, whether they can read at least four simple, popular words, and whether they know the name and recognize the symbols of all numbers from 1 to 10. If at least two of these are true, then the child is considered developmentally on track.
- Physical: If the child can pick up a small object with two fingers, like a stick or a rock from the ground and/or the mother/caretaker does not indicate that the child is sometimes too sick to play, then the child is regarded as being developmentally on track in the physical domain.
- Social-emotional: Children are considered to be developmentally on track if two of the following are true:

If the child gets along well with other children, if the child does not kick, bite, or hit other children and if the child does not get distracted easily.

- Learning: If the child follows simple directions on how to do something correctly and/or when given something to do, is able to do it independently, then the child is considered to be developmentally on track in this domain.

Due to the fact that Mongolia's Core Curriculum for Early Childhood Education³⁷ do not include teaching children the skills of naming letters of the alphabet and reading simple and popular words, four country-specific items were included in the module. Children who are developmentally on track in literacy- numeracy and physical domains are defined as below. The definitions about the social-emotional and learning domains are same as in the standard MICS calculation.

- Literacy- numeracy: Children are identified as being developmentally on track based on whether they can recognize/differentiate colors, recognize simple forms like, triangle, square or round, and whether they know the name and recognize the symbols of all numbers from 1 to 10. If at least two of these are true, then the child is considered developmentally on track.
- Physical: In addition to the two standard MICS items, i.e., the child can pick up a small object with two fingers, like a stick or a rock from the ground and/or the mother/caretaker does not indicate that the child is sometimes too sick to play, if the child can hold objects with his/her thumb, index finger or middle finger, like a spoon, fork or pen then the child is regarded as being developmentally on track in the physical domain providing that at least two of these are true.

ECDIs are then calculated as the percentage of children who are developmentally on track in at least three of these four domains. The findings are presented in Table TC.11.1 and TC.11.2.

¹SISS indicator TC.S1 – Early child development index – country specific^a Literacy–numeracy: Developmentally on track if at least two of the following is true: EC5H = 1 (Can identify some colours), EC5I = 1 (Can identify simple shapes such as triangle, square, circle, etc.), EC8–1 (Knows the name and recognizes the symbol of all numbers from 1 to 10).^b Physical: Developmentally on track if at least two of the following is true: EC9 = 1 (Can pick up a small object pinching with two fingers from the ground), EC9A = 1 (Can hold a spoon, a fork or a pencil with the thumb, index finger and middle finger), EC10 = 2 (Is not sometimes too sick to play).^c Due to the fact that Mongolia's Core Curriculum for Early Childhood Education do not include teaching children the skills of naming letters of the alphabet, and reading simple and popular words, some country–specific questions are included in the early childhood development module. Children who are developmentally on track in literacy–numeracy and physical domains are defined as above. The definitions about the other domains, social–emotional and learning are same as in Table TC.11.1.^p The category of "Don't know/Missing" in the background characteristic of "Functional difficulty" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25–49 unweighted cases.

8.1 EARLY CHILDHOOD EDUCATION

Readiness of children for primary school can be improved through attendance to early childhood education programmes or through pre-school. Early childhood education (ECE) programmes include programmes for children that have organised learning components as opposed to baby-sitting and day-care which do not typically have organised education and learning.

ECE legislation and policies governing provision of the services in Mongolia set the stage for public investments. Two pieces of legislation are of note. One is the 1995 Law of Primary and Secondary Education, which laid out the objective of preschool education as helping children develop their minds, bodies and personalities by providing an educational environment conducive to the development of talents, abilities and life skills¹. The second is the Mongolian Pre-school Education Law of 2008, which stipulates that the provision of food, books, manuals and appropriate toys for children attending state-owned kindergartens as well as the norm-based variable costs, will be financed through the state budget². At the same time, the mandatory age for entry into primary school was lowered from 7 to 6 years, which heightened interest in adequacy of pre-school services in the country to ensure school readiness at a younger age, 2 to 5 years.

Two types of ECE in Mongolia are: (i) fixed kindergartens and (ii) alternative forms of preschool education services. Fixed kindergartens generally operate eight hours a day, five

days a week from September to June. They provide training for speech development, basic mathematical abstractions, music and singing, physical development and fine arts. In addition, they conduct excursions and health enhancement activities. Mongolia's geographical spread has led to the creation of alternative forms of preschool education services that are mobile ger-kindergartens, in addition to the conventional fixed kindergartens. This type of service is particularly appropriate for the population group of herders to make available the service to their children².

Table LN.1.1 shows the percent of children age 2–4 and 3–4 years currently attending ECE. The standard MICS6 indicator, i.e., SISS indicator LN.1 refers to children age 3–4 years. This is based on question UB8 in the Questionnaire for Children under 5. If the child was currently on a school break, but regularly attends, the interviewer is asked to record this as currently attending.

Table LN.1.2 is similar to Table LN.1.1, but looks only at children who were 5 years old at the beginning of the school year. In Mongolia, the school year begins in September.

Specifically, the table presents the percent distribution of children age one year younger than the official primary school entry age at the beginning of the school year, by attendance to education. This table utilises question UB7 for attendance. The indicator captured is the adjusted net attendance ratio, which corresponds to SDG indicator 4.2.2: Participation rate in organised learning (adjusted³). The official primary school entry age in Mongolia is age 6 years.

1 The Parliament of Mongolia. The Law on Primary and Secondary Education of Mongolia, 1995.

2 The Parliament of Mongolia. The Law on Pre-school Education of Mongolia, 2008. Accessed April 26, 2019. <https://www.legalinfo.mn/law/details/462>.

3 The ratio is termed "adjusted" since it also includes children attending primary education. All children age one year before official primary school entry age (at the beginning of the school year) are included in the denominator.

^A The category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

8.2 ATTENDANCE

Attendance to pre–primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended any early childhood education the previous year⁴.

Ensuring that all girls and boys complete primary and secondary education is a target of the of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Mongolia, children enter primary school at age 6, lower secondary at age 11 and upper secondary school at age 15. There are 5 grades in primary school and 4 + 3 grades in secondary school. In primary school, grades are referred to as year 1 to year 5. For lower secondary school, grades are referred to as year 6 to year 9 and in upper secondary to year 10 to year 12. The school year typically runs from September of one year to June of the following year.

Table LN.2.2 presents the percentage of children of primary school entry age entering year 1.

Table LN.2.3 provides the percentage of children of primary school age 6 to 10 years who are attending primary or secondary school⁵, and those who are out of school. Similarly, the lower secondary school adjusted net attendance ratio is presented in Table LN.2.4⁶ for children age 11 to 14 years.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age–for–grade). For example, an 8–year–old child (at the beginning of the

school year) is expected to be in year 3, as per the official age–for–grade. If this child is currently in year 1, he/she will be classified over–age by 2 years. The table includes both primary and lower secondary levels.

The upper secondary school adjusted net attendance ratio, and out of school children ratio are presented in Table LN.2.6⁷.

The gross intake rate to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake rate is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

Completion rate of primary education represents the percentage of a cohort of children aged 3 to 5 years above the official age of the last grade of primary education, that is, the percentage of children who are 13 to 15 years old, who completed primary education in Mongolia.

The table also provides the “effective” transition rate which takes account of the presence of repeaters in the final grade of primary school. This indicator reflects situations in which pupils repeat the last grade of primary education but eventually make the transition to the secondary level.⁸

Table LN.2.8 focusses on the ratio of girls to boys attending primary and secondary education. These ratios are better known as the Gender Parity Index (GPI). Note that the ratios included here are obtained from adjusted net attendance ratios rather than gross attendance ratios. The latter provide an erroneous description of the GPI mainly because, in most cases, the majority of over–age children attending primary education tend to be boys.

4 The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre–primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

5 Ratios presented in this table are “adjusted” since they include not only primary school attendance, but also secondary school attendance in the numerator.

6 Ratios presented in this table are “adjusted” since they include not only lower secondary school attendance, but also attendance to higher levels in the numerator.

7 Ratios presented in this table are “adjusted” since they include not only upper secondary school attendance, but also attendance to higher levels in the numerator.

8 The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils’ progression to secondary school as it assumes that the repeaters never reach secondary school.

²SISS/MICS indicator LN.66 – Out-of-school rate for adolescents of lower secondary school age^a

^aThe percentage of children of lower secondary school age out of school are those who are not attending primary, secondary or higher education.

^bChildren age 15 or higher identified as emancipated.

^cThe category of "Don't know/Missing" in the background characteristic of "Mother's education", "Mother's functional difficulty (age 18-49 years)", and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

Table LN.2.5: Age for grade

	Percentage of children attending primary and lower secondary school who are underage, at official age and overage by 1 and by 2 or more years for grade, Mongolia, 2018

¹SISS/MICS indicator LN.5c – Upper secondary school net attendance ratio (adjusted)

²SISS/MICS indicator LN.6c – Out-of-school rate for youth of upper secondary school age

^aThe percentage of children of upper secondary school age out of school are those who are not attending primary, secondary or higher education.

^bChildren age 18 or higher at the time of the interview.

^cThe category of "Don't know/Missing" in the background characteristic of "Mother's education" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25-49 unweighted cases.

8.3 PARENTAL INVOLVEMENT

Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.⁹ Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.¹⁰

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.¹¹ Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.¹²

The PR module included in the Questionnaire for children age 5–17 years was developed and tested for inclusion in MICS6. The work is described in detail in MICS Methodological Papers (Paper No. 5).¹³

Table LN.3.1 presents percentages of children age 7–14 years for whom an adult household member received a report card and was involved in school management and school activities in the last year, including discussion with teachers on children's progress.

In Table LN.3.2 reasons for children unable to attend class due to a school-related reasons are presented. Reasons include natural and man-made disaster, teacher strike and teacher absenteeism.

Lastly, Table LN.3.3 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, percentage whose teachers use the language also spoken at home, and percentage of children who receive help with homework.

na: not applicable
^a Attendance to school here is not directly comparable to net attendance ratios reported in preceding tables, which utilize information on all children in the sample. This and subsequent tables present results of the Parental Participation and Foundational Learning Skills modules administered to mothers of a randomly selected subsample of children age 7-14 years.
^b School management sector was collected for children attending primary education or higher. Children out of school or attending ECE are not shown.
^c The category of "Don't know/missing" in the background characteristic of "School management", "Child's functional difficulty", "Mother's functional difficulty (age 18-49 years)", and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
^d SSISS/MICS indicator LN.12 - Availability of information on children's school performance
^e SSISS/MICS indicator LN.13 - Opportunity to participate in School Management
^f SSISS/MICS indicator LN.14 - Participation in school management
^g SSISS/MICS indicator LN.15 - Effective participation in school management
^h SSISS/MICS indicator LN.16 - Discussion with teachers regarding children's progress

8.4 FOUNDATIONAL LEARNING SKILLS

The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet in many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Analysis Programme of the CONFEMEN Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ).¹⁴ Acquiring literacy in the early grades of primary is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.¹⁵

A strong foundation in basic numeracy skills during the early grades is crucial for success in mathematics in the later years. Mathematics is a skill very much in demand and most competitive jobs require some level of skill in mathematics. Early mathematical knowledge is a primary predictor of later academic achievement and future success in mathematics is related to an early and strong conceptual foundation.¹⁶

There are a number of existing tools for measuring learning outcomes¹⁷ with each approach having their own strengths and limitations as well as varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: “Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, (...) much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments”, according to longitudinal surveys like the Young Lives

Study.¹⁸ National assessments such as the Early Grade Reading Assessment, which happens earlier and is more context specific, will however be less appropriate for cross-country analysis; although it may be possible to compare children who do not complete an exercise (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognized that some assessments only capture children in school. However, given that many children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys.

Tables LN.4.1 and LN.4.2 present percentages of children age 7–14 years who correctly answered foundational reading tasks and numeracy skills, respectively, by age, sex, location, region, wealth index quintile and other disaggregation. These MICS indicators are designed and developed for both national policy development and SDG reporting for SDG4.1.1(a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex.

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognitions are also available.

The section of the Foundational Learning module capturing numeracy skills can be found in Appendix E (Questionnaire for children age 5–17 years), questions FL23–FL27. Specifically question FL26 is a set of instructions for the interviewer, including to administer two practise items to prepare the child for the following task of pattern recognition and completion. This task (question FL27) includes five items.

Unfortunately, a small proportion of interviewers across SISS, 2018 in Mongolia and elsewhere recorded the results of the two practise items in the data collection application, effectively shifting the responses in FL27 two spaces. During secondary editing such cases were identified and shifted back to the correct position, but the consequence remained of the loss of answers to the two last of the five pattern recognition items. The module has now been redesigned to avoid the occurrence of this problem.

While producing this report, several options were considered for presentation of the findings:

1. Use all children in the table. This would present the best possible estimates on the tasks of number reading, number discrimination and addition, but underestimate on pattern recognition and, most importantly, on the overall indicator of foundational numeracy skills.
2. Exclude children affected by the shifted entries. This would impact all results in the tables, but the extent of the impact would need further analysis and depends largely on the amount and distribution of the excluded cases.
3. Use a mixed approach, presenting number reading, number discrimination and addition for all children and the pattern recognition and overall indicator only on

children not affected by the shifted entries, effectively using two denominators in the table.

4. Not presenting the table and indicator as per methodology, reducing the requirement of successful completion in pattern recognition to three items rather than five. This would overestimate pattern recognition and the overall indicator compared to standard methodology.

Following analysis of the extent and distribution of shifted cases, option 2 was selected as score distributions of first three items of pattern recognition are comparatively close across shifted and non-shifted samples which indicates that excluding shifted cases would affect marginally overall average while addressing biases introduced by shifted cases.

For information, the total values for Mongolia using the total number of children were: For number reading, number discrimination and addition, respectively, 90.1, 89.2 and 69.1. As seen in the below table LN.4.2, this is slightly different than the values there of: 93.1, 92.4 and 74.2. The difference is well within confidence intervals surrounding the values. Knowledge of this departure from the standard methodology should however be kept in mind when utilising the results.

The total number of weighted cases removed from the denominator, i.e. those affected by the shift, are 697 or 10.1 percent of children completing the Foundational Learning module.

Table LN.4.1: Reading skills

Percentage of children aged 7–14 who demonstrate foundational reading skills by successfully completing three foundational reading tasks, by sex, Mongolia, 2018

PROTECTED FROM VIOLENCE AND EXPLOITATION

9.1 BIRTH REGISTRATION

Having a name and nationality is every child's right, enshrined in the Convention on the Rights of the Child (CRC) and other international treaties. Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed.¹

Birth certificates are proof of registration and the first form of legal identity and are often required to access health care or education. Having legal identification can also be one form of protection from entering into marriage or the labour market, or being conscripted into the armed forces, before the legal age. Birth registration and certification is also legal proof of one's place of birth and family ties and thus necessary to obtain a passport. In adulthood, birth certificates may be required to

obtain social assistance or a job in the formal sector, to buy or inherit property and to vote.

Legal interactions concerning a child's birth registration are governed by the Law of Mongolia on Citizenship.² The law requires a parent, entrusted individual or a representative to have new born children registered at the administrative agency for citizen registration within 30 days after birth and receive a birth certificate.

As part of cooperative efforts by the General Authority for State Registration, Ministry of Health, National Statistical Office towards improving the civil registration and electronic database, children are assigned state registration number at birth from October 1st, 2018 in 7 maternity hospitals in Ulaanbaatar, and has continued to be implemented nationwide from November, 2018.³

¹SISS/MICS indicator PR.1 – Birth registration; SDG indicator 16.9.1

^A Children age 0–1 years are excluded, as functional difficulties are only collected for age 2–4 years.

^B The category of "Don't know/Missing" in the background characteristic of "Child's functional difficulty (age 2–4 years)", "Mother's functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

9.2 CHILD DISCIPLINE

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. Too often however, children are raised using punitive methods that rely on the use of physical force or verbal intimidation to obtain desired behaviours. Studies⁴ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm

that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and depression; and, at times, it leads to risk taking and self-harm.

In the SISS 2018, mothers or caretakers of children under age five and of one randomly selected child aged 5–17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

9.3 CHILD LABOUR

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. Article 32 (1) of the CRC states: “States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child’s education, or to be harmful to the child’s health or physical, mental, spiritual, moral or social development”.

Mongolia is a member of several international agreements – having joined the CRC in 1990, Optional Protocol to the Convention on the Rights of the Child (OHCHR) in 2003, Optional Protocol to the Convention on the Rights of the Child on the Involvement of Children in Armed Conflict (OPAC) in 2004. Moreover, Mongolia has ratified all 8 ILO fundamental conventions including the ratification of Minimum Age Convention in 2002 and Worst Forms of Child Labour Convention in 2001.

The child labour module was administered for one randomly selected child age 5–17 years in each household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).⁵ The module also collects information on hazardous working conditions.^{6,7}

Table PR.3.1 presents children’s involvement in economic activities. The methodology of the MICS Indicator on Child Labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours is classified as in child labour:

- i. age 5–11: 1 hour or more
- ii. age 12–14: 14 hours or more
- iii. age 15–17: 43 hours or more

Table PR.3.2 presents children’s involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as in child labour:

- i. age 5–11 and age 12–14: 28 hours or more
- ii. age 15–17: 43 hours or more

SDG Target 8.7 aims to “take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.” The SDG indicator 8.7.1 provides the proportion of children aged 5–17 years who are engaged in child labour. Table PR.3.3 combines the children working and performing economic activities and household chores at or above and below the age-specific thresholds as detailed in the previous tables, as well as those children reported working under hazardous conditions, into the total child labour indicator.⁸

5 Please note that activities of collecting firewood and fetching water per Resolution I, Section 22(b), of the 19th International Conference of Labour Statisticians (ICLS) is to be classified as own-use production work, i.e. an economic activity. Because the 20th ICLS is expected to discuss this classification and this classification has enormous impact on child labour prevalence in large parts of the world, these activities remain classified as household chores in MICS, pending outcome of the ICLS.

6 UNICEF. How Sensitive Are Estimates of Child Labour to Definitions?. MICS Methodological Paper No. 1. New York: UNICEF, 2012. https://data.unicef.org/wp-content/uploads/2015/12/Child_Labour_Paper_No.1_FINAL_162.pdf.

7 The Child Labour module was administered in the Questionnaire for Children Age 5–17 (See Appendix E: Questionnaires). In households with at least one child age 5–17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5–17 in each household; this weight is used when producing the relevant tables.

8 Note that the definition of child labour, hence the MICS indicator PR.3 presented in this report, also includes working in activities that are hazardous in nature. However, to ensure comparability of estimates, it has been decided by UNICEF and ILO to exclude engagement in hazardous occupations or under hazardous working conditions from the estimates of child labour for the purpose of reporting on SDG 8.7.1 in 2018. Another reason for exclusion of hazardous conditions in the reporting is the further methodological work needed to validate questions aimed at identifying children engaged in hazardous activities.

9.4 CHILD MARRIAGE

Marriage⁹ before the age of 18 is violation of human rights, yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights – with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but does occur around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage does place boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.¹⁰

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.^{11,12} In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Tables PR.4.1W and PR.4.1M present the percentage of women and men married before ages 15 and 18 years, the percentage of adolescent girls aged 15–19 who are currently married, and the percentage of women in a polygynous union.

Tables PR.4.2W and PR.4.2M present, respectively, the proportion of women and men who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of married/in union women 10 or more years younger than their current spouse. Table PR.4.3 presents the results of the age difference between women and their husband or partner.

9 All references to marriage in this chapter include cohabiting unions as well.

¹ SISS/MICS indicator PR.7a – Spousal age difference (among women age 15–19)

² SISS/MICS indicator PR.7b – Spousal age difference (among women age 20–24)

^a The category of “Don't know/Missing” in the background characteristic of “Ethnicity of household head” has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

.. - Zero unweighted cases base a percent.

9.5 VICTIMISATION

Crime can have a large impact the lives of victims and the wider community in which they live. Those who are victims of crimes can suffer physically and psychologically and experience loss of assets and income. Crime can also carry significant economic costs to the community through the provision of preventative measures as well as corrective services¹³.

An additional question was included to the MICS6 standard questionnaire in the SISS with the purpose of capturing the extend of reporting to police when the person is a victim to theft or fraud.

Tables PR.6.1W and PR.6.1M present the percentage of women and men who were victims of robbery or assault in the last 3 and 1 year prior to the survey, by various background characteristics. Tables PR.6.2W and PR.6.2M show if weapons (namely, knife, gun or other weapons) were used during the last robbery. Tables PR.6.3W and PR.6.3M expand on the circumstances of the latest assault, indicating where it took place and type of weapon used. Finally, Tables PR.6.4W and PR.6.4M indicate if the last robbery or assault experienced by women and men was reported to the police. The table also includes percentage of women and men who reported experience of theft or fraud within 1 year prior to the survey.

¹SISS/MICS indicator PR.13 - Crime reporting; SDG indicator 16.3.1

^a This indicator is constructed using both last incidences of robbery and assault, as respondents may have experienced 1) no incident; 2) one last incident of either robbery or assault or 3) both robbery and assault.
^b The category of "Don't know/missing" in the background characteristic of "Functional difficulty (age 18-49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
^c Figures that are based on 25-49 unweighted cases.
^d Figures that are based on fewer than 25 unweighted cases.

Table PR.6.4M: Reporting of robbery and assault in the last one year (men)

		Percentage of men for whom last incident of robbery was reported to the police				Number of men experiencing robbery in the last year		Percentage of men for whom last incident of assault was reported to the police		Number of men experiencing assault in the last year		Percentage of men for whom the last incident of physical violence of robbery and/or assault in the last year was reported to the police ^{1A}		Number of men experiencing physical violence of robbery or assault in the last year

^{1A}SSSMICS indicator PR.13 – Crime reporting; SDG indicator 16.3.1
^BThis indicator is constructed using both last incidences of robbery and assault, as respondents may have experienced 1) no incident, 2) one last incident of either robbery or assault or 3) both robbery and assault.
^CThe category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
(*) Figures that are based on 25–49 unweighted cases.
(†) Figures that are based on fewer than 25 unweighted cases.

Table PR.6.5W: Victims of theft and cunning (women)

Percentage of women age 15–49 years who were victims of theft and cunning in the last 12 months and percent distribution of reportedness, Mongolia, 2018

^a The category of "Don't know/Missing" in the background characteristic of "Education", "Functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.
 () Figures that are based on 25–49 unweighted cases.
 (*) Figures that are based on fewer than 25 unweighted cases.

9.6 FEELINGS OF SAFETY

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important

as such perceptions limit people's freedom of movement and influence how they manage threats to their safety.¹³

Tables PR.7.1W and PR.7.1M present data for women and men on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

Table PR.7.1W: Feelings of safety (women)

	Percent distribution of women age 15–49 years by feeling of safety walking alone in their neighbourhood after dark and being home alone after dark, Mongolia, 2018															
	Percent distribution of women who walking alone in their neighbourhood after dark feel:					Percent distribution of women who being home alone after dark feel:										
	Very safe	Safe	Unsafe	Very unsafe	Never walk alone after dark	Total	Percentage of women who feel safe walking alone in their neighbourhood after dark ¹	Very safe	Safe	Unsafe	Very unsafe	Never home alone after dark	Total	Percentage of women who feel safe home alone after dark	dark feel very unsafe walking alone in their neighbourhood or being home alone	Number of women

9.7 ATTITUDES TOWARDS DOMESTIC VIOLENCE

SISS 2018 assessed the attitudes of women and men age 15–49 years towards wife beating by asking the respondents whether they think that husbands are justified to hit or beat their wives in a variety of situations. The purpose of these

questions is to capture the social justification of violence (in contexts where women have a lower status in society) as a disciplinary action when a woman does not comply with certain expected gender roles. The responses to these questions can be found in Table PR.8.1W for women and in Table PR.8.1M for men.

Table PR.8.1W: Attitudes toward domestic violence (women)							
Percentage of women age 15–49 years who believe a husband is justified in beating his wife in various circumstances, Mongolia, 2018							
	Percentage of women who believe a husband is justified in beating his wife:						Number of women
	If she goes out without telling him	If she neglects the children	If she argues with him	If she refuses sex with him	If she burns the food	For any of these five reasons ¹

LIVE IN A SAFE AND CLEAN ENVIRONMENT

10.1 DRINKING WATER

Access to safe drinking water, sanitation and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right¹. Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary responsibility for carrying water, often for long distances.²

The SDG targets relating to drinking water are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1). For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.³

The distribution of the population by main source of drinking water is shown in Table WS.1.1. The population using improved sources of drinking water are those using any of the following types of supply: piped water (into dwelling,

compound, yard or plot, to neighbour, public tap/standpipe), protected tube well/borehole, protected dug well, protected spring, rainwater collection, and packaged or delivered water⁴.

Table WS 1.2 shows the amount of time taken per round trip to collect water for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip for water collection meet the SDG criteria for a 'basic' drinking water service.

Table WS.1.3 presents the sex and age of the household member usually responsible for water collection among household members without water sources on premises. Table WS 1.4 shows the average time spent each day by the household member mainly responsible for collecting drinking water.

Table WS.1.5 shows the proportion of household members with sufficient water available when needed from their main source of drinking water and the main reasons household members are unable to access water in sufficient quantities when needed.

Table WS.1.6 presents the proportion of household members with an indicator of faecal contamination detected in their drinking water source. The risk of faecal contamination is shown based on the number of *Escherichia coli* (*E. coli*) bacteria detected, ranging from low (<1 *E. coli* per 100 mL), to moderate (1–10 *E. coli* per 100 mL), high (11–100

1 The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

2 WHO, and UNICEF. *Safely Managed Drinking Water: thematic report on drinking water*. Geneva: WHO Press, 2017. <https://data.unicef.org/wp-content/uploads/2017/03/safely-managed-drinking-water-JMP-2017-1.pdf>.

3 "Home." JMP. Accessed September 06, 2018. <https://washdata.org/>.

4 Packaged water (bottled water and sachet water) and delivered water (tanker truck and cart with small drum/tank) are treated as improved based in new SDG definition.

E. coli per 100 mL) and very high risk (>100 E. coli per 100 mL). Table WS.1.7 shows the proportion of household members with E. coli detected in their household drinking

water. Contamination may occur between the source and the household during transport, handling and storage.

Table WS.1.8 shows the proportion of household population with improved and unimproved drinking water sources

Table WS.1.1: Use of improved and unimproved water sources

10.2 HANDWASHING

Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five⁵. It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place^{6,7}.

Hygiene was omitted from the MDGs but has been included in the SDG targets which aim to achieve universal access to a basic handwashing facility at home (SDG 1.4 and 6.2).

Table WS.2.1 shows the proportion of household members with fixed or mobile handwashing facilities observed on premises (in the dwelling, yard or plot). It also shows the proportion of handwashing facilities where water and soap were observed. Household members with a handwashing facility on premises with soap and water available meet the SDG criteria for a 'basic' handwashing facility.

5 Cairncross, S. and V. Valdmanis. "Water supply, sanitation and hygiene promotion Chapter 41." in *Disease Control Priorities in Developing Countries*. 2nd Edition, edited by Jameson et al. Washington (DC): The International Bank for Reconstruction and Development / The World Bank.

6 Ram, P. *Practical Guidance for Measuring Handwashing Behavior: 2013 Update*. Global Scaling Up Handwashing. Washington DC: World Bank Press, 2013.

7 Handwashing place or facilities may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent, and soapy water but does not include ash, soil, sand or other handwashing agents.

Table WS.2.1: Handwashing facility with soap and water on premises

Percent distribution of household members by observation of handwashing facility and percentage of household members by availability of water and soap or detergent at the handwashing facility, Mongolia, 2018

¹ SSISS/MICS indicator WS.7 – Handwashing facility with water and soap. SDG indicators 1.4.1 & 6.2.1

() Figures that are based on 25–49 unweighted cases.

10.3 SANITATION

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third⁸, and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases which affect over 1 billion people worldwide⁹.

The SDG targets relating to sanitation are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2).

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. The international definition for improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets whereas in Mongolia most of the pit latrines being used by ger district households do not have porous lining which isolates the excreta in latrines from the soil and are considered to be not met with hygiene standards, thus excluded improved sanitation facilities. Table WS.3.1 shows the population using improved and unimproved sanitation facilities (by both international and national definitions). It also shows the proportion who dispose of faeces in open spaces, a practice known as 'open defecation'.

Table WS. 3.2 presents the distribution of household population using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classed as having a 'limited' service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for a 'basic' sanitation service, and may be considered 'safely managed' depending on how excreta are managed.

Table WS.3.3 shows the methods used for emptying and removal of excreta from improved pit latrines and septic tanks. Excreta from improved pit latrines and septic tanks that is never emptied (or don't know if ever emptied) or is emptied and buried in a covered pit is classed as 'safely disposed in situ' and meets the SDG criteria for a 'safely managed' sanitation service. Excreta from improved pit latrines and septic tanks that is removed by a service provider to treatment may also be safely managed, depending on the type of treatment received. Other methods of emptying and removal are not considered 'safely managed'.

Table WS.3.4 summarises the main ways in which excreta is managed from households with improved on-site sanitation systems (improved pit latrines and septic tanks) and compares these with the proportion with sewer connections, unimproved sanitation or practicing open defecation.

Table WS.3.5 shows the main methods used for disposal of child faeces among households with children aged 0–2 years. Appropriate methods for disposing of the stool include the child using a toilet or latrine and putting or rinsing the stool into a toilet or latrine. Putting disposable diapers with solid waste, a very common practice throughout the world, is only considered an appropriate means of disposal if there is also a system in place for hygienic collection and disposal of the solid waste itself. This classification is currently under review.

The JMP has produced regular estimates of national, regional and global progress on drinking water, sanitation and hygiene (WASH) since 1990. The JMP service 'ladders' enable benchmarking and comparison of progress across countries at different stages of development. As of 2015, updated water and sanitation ladders have been introduced which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for handwashing hygiene¹⁰. Table WS.3.6 summarises the percentages of household population meeting the SDG criteria for 'basic' drinking water, sanitation and handwashing services.

^a In many countries, disposal of children's faeces with solid waste is a common. The risks will vary between and within countries depending on whether solid waste is regularly collected and well managed. For the purposes of international comparability solid waste is not considered safely disposed.

^b The category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

10.4 MENSTRUAL HYGIENE

The ability of women and adolescent girls to safely manage their monthly menstrual cycle in privacy and with dignity is fundamental to their health, psychosocial well-being and mobility. Women and girls who lack access to adequate menstrual hygiene management facilities and supplies experience stigma and social exclusion while also forgoing important educational, social and economic opportunities.¹¹

Table WS.4.1 shows the percentage of women and girls aged 15–49 who menstruated in the last 12 months reporting having a private place to wash and change while at home. It also presents whether they used appropriate materials including reusable and non-reusable materials during last menstruation.

Table WS.4.2 shows the percentage of women who reported not being able to participate in social activities, school or work during their last menstruation.

11 Sommer, M., C. Sutherland and V. Chandra-Mouli. "Putting Menarche and Girls into the Global Population Health Agenda." *Reproductive Health* 12, no. 1 (2015). doi:10.1186/s12978-015-0009-8.

Table WS.4.1: Menstrual hygiene management

¹ SISS/MICS indicator WS.13 – Exclusion from activities during menstruation

^A The category of “Don’t know/Missing” in the background characteristic of “Functional difficulty (age 18–49 years)” and “Ethnicity of household head” has been suppressed from the table due to small number of unweighted cases.

11.1 CHILD FUNCTIONING

The Convention on the Rights of Persons with Disabilities¹ outlines States Parties' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in an unaccommodating environment, and limit the fulfilment of their rights.

SISS 2018 included child functioning modules intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a similar module is also included in the Questionnaire for Children Age 5–17.

Functional domains covered in Questionnaire for Children Under Five are as follows: Seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in Questionnaire for Children Age 5–17 are as follows: Seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression.

Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2–17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

¹ "Convention on the Rights of Persons with Disabilities." United Nations. Accessed August 31, 2018. <https://www.un.org/development/desa/disabilities/convention-on-the-rights-of-persons-with-disabilities/convention-on-the-rights-of-persons-with-disabilities-2.html>.

^a Functional difficulty for children age 2–4 years are defined as having responded "A lot of difficulty" or "Cannot at all" to questions within all listed domains, except the last domain of controlling behaviour, for which the response category "A lot more" is considered a functional difficulty.

^b The category of "Don't know/Missing" in the background characteristic of "Mother's functional difficulty (age 18–49 years)" and "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

11.2 DISCRIMINATION AND HARASSMENT

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months before the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recall of events. The current questions are

based on a recommended set of questions available at the start of MICS6 and added 5 questions based on country specific situation. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Tables EQ.3.1W and EQ.3.1M show the percentage of women and men who felt discriminated against based on a number of grounds.

Table EQ.3.1W: Discrimination and harassment (women)

Percentage of women age 15–49 years who in the past 12 months have felt discriminated against or harassed and those who have not felt discriminated against or harassed, Mongolia, 2018																
Percentage of women who in the last 12 months have felt discriminated against or harassed on the basis of:																
	Ethnic or immigration origin	Gender	Sexual orientation	Age	Religion or belief	Disability	Birthplace	Rural–urban disparity	Living standard (rich, poor)	Place of current residence (apartment or ger district)	Level of education	Reason ¹			Percentage of women who have not felt discriminated against or harassed in the last 12 months	Number of women

11.3 SUBJECTIVE WELL-BEING

Subjective perceptions of individuals of their incomes, health, living environments and the like, play a significant role in their lives and can impact their perception of well-being, irrespective of objective conditions such as actual income and physical health status².

SISS 2018 included a question about happiness and the respondents' overall satisfaction with life. To assist respondents in answering the question on happiness, they were shown a card with smiling faces (and not so smiling faces) that corresponded to the response categories (see the Questionnaires in Appendix E) 'very happy', 'somewhat happy', 'neither happy nor unhappy', 'somewhat unhappy' and 'very unhappy'. They were then shown a pictorial of a ladder with steps numbered from 0 at the bottom to 10 at the top and asked to indicate at which step of the ladder they feel they are standing at the time of the survey to indicate their level

of life satisfaction. Tables EQ.4.1W and EQ.4.1M present the percentage of women age 15–49 years, and age 15–24 years separately, who are very or somewhat satisfied with their life overall, ladder step reported and the average life satisfaction score.

In addition to the questions on life satisfaction and happiness, respondents were also asked two simple questions on whether they think their life improved during the last one year, and whether they think their life will be better in one year's time. Such information may contribute to the understanding of desperation that may exist among young people, as well as hopelessness and hopes for the future. Specific combinations of the perceptions during the last one year and expectations for the next one year may be valuable information to understand the general sense of well-being among young people. In Tables EQ.4.2W and EQ.4.2M, women's and men's perceptions of a better life are shown.

2 OECD. OECD Guidelines on Measuring Subjective Well-being. Paris: OECD Publishing, 2013. https://read.oecd-ilibrary.org/economics/oecd-guidelines-on-measuring-subjective-well-being_9789264191655-en#page1.

^a In MICS, the adult functioning module is asked to individual respondents age 18–49 for the purpose of disaggregation. No information is collected on eligible household members who, for any reason, were unable to complete the interview. It is expected that a significant proportion of the 93 cases of respondents for whom the response code "Incapacitated" was indicated for the individual interview are indeed incapacitated due to functional difficulties. The percentage of women with functional difficulties presented here is therefore not representing a full measure and should not be used for reporting on prevalence in the population.

() Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

Table SR-8. 1PM: Adult functioning (men age 18–49 years)

¹ SISS/MICS indicator TM.13 – Post-natal health check for the newborn

^a Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).

^b Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the newborn and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note a above).

^c Post-natal health checks include any health check performed while in the health facility or at home following birth (see note A above), as well as PNC visits (see note B above) within two days of delivery.

Table TM.8.3P: Post-natal care visits for newborns within one week of birth

Percent distribution of women age 15–49 years with a live birth in the last 2 years whose most recent live-born child received a post-natal care (PNC) visit within one week of birth, by location and provider of the first PNC visit by target province and district, Mongolia, 2018

^a SISS/MICS indicator TM.29 – Knowledge about HIV prevention among young people

^a Means of HIV transmission determining comprehensive knowledge about HIV prevention among young people comprise of the questions of mosquito bites, sharing food with someone with HIV and superstition in accordance with the MICS6 standards. However, the means of superstition was excluded from the questionnaires since its concept did not suit in the Mongolian context.

^b Comprehensive knowledge about HIV prevention includes those who know of the two ways of HIV prevention (having only one faithful uninfected partner and using a condom every time), who know that a healthy-looking person can be HIV-positive and who reject the two most common misconceptions about HIV transmission.

Table TM.11.1PM: Knowledge about HIV transmission, misconceptions about HIV, and comprehensive knowledge about HIV transmission (men)

	Percentage of men age 15–49 years who know the main ways of preventing HIV transmission, percentage who know that a healthy-looking person can be HIV-positive, percentage who reject common misconceptions, and percentage who have comprehensive knowledge about HIV transmission by target province and district, Mongolia, 2018

^a Basic antigens include: BCG, Polio1–3, Penta1–3, MMR1.

^b Includes children for whom vaccination cards or other documents were observed with at least one vaccination dose recorded (Card availability).

^c All antigens include: BCG, Polio1–3, Penta1–3, HepA1–2 and MMR2 as per the vaccination schedule in Mongolia.

^d The category of "Don't know/Missing" in the background characteristic of "Ethnicity of household head" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25–49 unweighted cases.

Table TC.2.1P: Reported disease episodes				
Percentage of children age 0–59 months for whom the mother/caretaker reported an episode of diarrhoea, symptoms of acute respiratory infection (ARI), and/or fever in the last two weeks by target province and district, Mongolia, 2018

¹SISS/MICS indicator TC.39a – Minimum acceptable diet (breastfed children)

²SISS/MICS indicator TC.39b – Minimum acceptable diet (non-breastfed children)

³SISS/MICS indicator TC.40 – Milk feeding frequency for non-breastfed children

⁴SISS/MICS indicator TC.41 – Minimum dietary diversity

⁵SISS/MICS indicator TC.42 – Minimum meal frequency

^A Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

^B Minimum meal frequency among currently breastfeeding children is defined as children who also received solid, semi-solid, or soft foods 2 times or more daily for children age 6–8 months and 3 times or more daily for children age 9–23 months. For non-breastfeeding children age 6–23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times.

^C The minimum acceptable diet for breastfed children age 6–23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings and that the minimum dietary diversity is achieved without counting milk feeds.

() Figures that are based on 25–49 unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases.

Nalaikh district	69.3	97.4	74.1	96.3	86.8	189
¹SISS indicator TC.S1 – Early child development index – country specific						
^A Literacy–numeracy: Developmentally on track if at least two of the following is true: EC5H = 1 (Can identify some colours), EC5I = 1 (Can identify simple shapes such as triangle, square, circle, etc.), EC8=1 (Knows the name and recognizes the symbol of all numbers from 1 to 10).						
^B Physical: Developmentally on track if at least two of the following is true: EC9 = 1 (Can pick up a small object pinching with two fingers from the ground), EC9A = 1 (Can hold a spoon, a fork or a pencil with the thumb, index finger and middle finger), EC10 = 2 (Is not sometimes too sick to play).						
^C Due to the fact that Mongolia's Core Curriculum for Early Childhood Education do not include teaching children the skills of naming letters of the alphabet, and reading simple and popular words, some country–specific questions are included in the early childhood development module. Children who are developmentally on track in literacy–numeracy and physical domains are defined as above. The definitions about the other domains, social–emotional and learning are same as in Table TC.11.1.

APPENDIX A

SAMPLE DESIGN

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the 2018 Social Indicator Sample Survey (SISS) was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for the five regions and 8 target provinces/districts of the country: regions of Western, Khangai, Central, Eastern and Ulaanbaatar, provinces of Bayan-Ulgii, Bayankhongor, Govi-Altai, Zavkhan, Umnugovi, Khuvsgul and districts of Bayanzurkh and Nalaikh. The sampling strata consisted of the eight target provinces/districts and the remaining (non-target) parts in each of the five regions, all together 13 strata. Within each sampling stratum there was an implicit stratification by urban and rural areas. In designing the sample for the SISS, it was useful to review the sample design and results of the SISS conducted in 2013, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on the 2017 Population and Household Registry (PHR). The primary sampling units (PSUs) selected at the first stage were the enumeration areas (EAs) defined for this survey. To form EAs, all baghs and khesegs were split into subdivisions of those baghs and khesegs with approximately

200 households on average. The baghs are the smallest administrative unit in a province (or aimag). The khesegs are not administrative units per se, but are subdivisions of the lowest administrative unit (khoroo) in the capital city. A listing of households was conducted in each sample EA, and a sample of households was selected at the second stage.

A.1 SAMPLE SIZE AND SAMPLE ALLOCATION

Since the overall sample size for the SISS partly depends on the geographic domains and stakeholders' interest of analysis that are defined for the survey tables, the distribution of EAs and households in Mongolia from the 2017 PHR sampling frame was first examined by region, target provinces/districts, and urban and rural areas shown in Table SD.1.

The overall sample size for the SISS was calculated as 14,500 households. For the calculation of the sample size, the key indicator used was pre-school attendance among children age 3–4 years old. Since the survey results are tabulated at the regional level and target provinces/districts, it was necessary to determine the minimum sample size for each region and target provinces/districts. The following formula was used to estimate the required sample size for this indicator:

$$n = \frac{[4(r)(1-r)(deff)]}{[(RME \times r)^2 (pb)(AveSize)(RR)]}$$

where:

n = the required sample size, expressed as number of households

4 = a factor to achieve the 95 percent level of confidence

r = the predicted or anticipated value of the indicator, expressed in the form of a proportion

deff = the design effect for the indicator, estimated from a previous survey or using a default value of 1.5

RME = the relative margin of error of *r* to be tolerated at the 95 percent level of confidence; it is generally not more than 0.12 (12 percent) for national-level estimates

pb = the proportion of the total population upon which the indicator, *r*, is based

AveSize = the average household size (mean number of persons per household)

RR = the predicted response rate

Table SD.1: Distribution of Enumeration Areas and households in sampling frame

Distribution of EAs and households, by region, urban and rural strata, Population and Household Registry, 2017						
	Number of EAs			Number of Households (2017 PHR)

Nalaikh	49	49	–	10,593	10,593	–
Other	1,399	1,399	–	279,077	279,077	–

For the calculation, *r* (prevalence of pre-school attendance) was assumed to be 68.2 percent based on the national estimate from the 2013 SISS. The value of *deff* (design effect) was taken as 1.58 based on the estimate from the 2013 SISS, *pb* (percentage of children age 3–4 years in the total population) was taken as 4.9 percent, *AveSize* (mean household size) was taken as 3.5 households, and the response rate was assumed to be 95 percent, based on experience from the 2013 SISS. An RME of 3.7 percent for the national level estimates resulted in a sample of nearly 12,500 households initially. For the regional level estimates, RMEs ranged between 5.1–14.1

percent. However, estimates for the target provinces/districts required extra exercises to define the final sample size. As a result, the sample size increased in 6 provinces and 2 districts, comprising of three target provinces (or aimags) in the Western region (Bayan-Ulgii, Govi-Altai and Zavkhan); two in the Khangai region (Bayankhongor and Khuvsgul); one in the Central region (Umnugovi) and two target districts in Ulaanbaatar (Bayanzurkh and Nalaikh). Consequently, the final sample size reached 14,500 households. Allocation of 1,100 households per target province/district produced RMEs of 11 percent at most that were treated as an acceptable

precision for the targeted province/district level estimates. Table SD.2 summarizes the final sample size as it indicates a smaller sample was proposed in non-target provinces/districts within each region because it was not needed to present estimates for these provinces/districts.

The number of households selected per cluster for the SISS was determined as 25 households, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster. Dividing the total number of households by the number of sample households per cluster, it was calculated that 580 sample clusters would need to be selected.

Square root allocation of the total sample size to the five regions with a slight compromise between them was used. Therefore, 148 clusters were allocated to Western region (of which 44 clusters to Bayan-Ulgii, Govi-Altai, Zavkhan respectively and 16 clusters to the non-target parts of the region); 120 clusters to Khangai region (of which 44 clusters were allocated to each of Bayankhongor and Khuvsgul, and 32 clusters to the non-target parts of the region); 96 clusters to Central region (of which 44 clusters to Umnugovi and 52 clusters to the non-target parts of the region); 80 clusters to Eastern region; and 136 clusters to Ulaanbaatar (of which 44 clusters were allocated to each of Bayanzurkh and Nalaikh, and 48 clusters to the non-target parts of the region). The final sample size was estimated as 14,500 households (580

clusters from 5 regions (inclusive of 13 target provinces/districts and the non-target part within each region) * 25 sample households per cluster). In each region, the clusters (primary sampling units) were distributed to the urban and rural areas proportionally to the number of people in the PHR frame for each stratum within that region. This was achieved through implicit stratification by urban/rural within each stratum. Table SD.2 shows the allocation of the clusters and households to the sampling strata.

A.2 SELECTION OF PRIMARY SAMPLING UNITS (CLUSTERS)

Since the number of households residing in the bagh and kheseg varied substantially, a split was undertaken with approximately 200 households on average to form enumeration areas within the bagh and kheseg prior to the sampling. Following that, the PSUs were selected from each of the sampling strata by using systematic probability proportional to size (pps) sampling procedures, based on the number of people in each enumeration area from the 2017 PHR frame. The first stage of sampling was thus completed by selecting the required number of sample EAs (specified in Table SD.2) from each of the 13 strata within five regions. Implicit stratification on urban and rural areas was achieved by systematic sampling from a list of EAs sorted geographically (from residential areas to remote areas) within each province and district.

Table SD.2: Sample allocation						
Allocation of sample clusters (EAs) and sample households to sampling strata, SISS, 2018

Other	48	48	–	1,200	1,200	–

A.3 LISTING ACTIVITIES

Given that there had been many changes in the households recorded in the 2017 PHR, a new listing of households was conducted in all the sample enumeration areas prior to the selection of households. For this purpose, bagh and khoroo (a parent administrative unit of kheseqs) offices were instructed to update all the selected baghs and kheseqs and re-list all households in each bagh and kheseg in accordance with the household listing manual. The household listing was conducted in August and September 2018. The listing operation consisted of contacting each household of the selected EAs and updating an address of a dwelling, name of a household head, a residential status, age and number of household members on the Population and Household Database. The residential status was specifically important to identify whether the household members would be interviewed at the recorded address during the data collection.

A.4 SELECTION OF HOUSEHOLDS

Lists of households were prepared by the bagh and khoroo office in the field for each cluster. The households were firstly sorted by households with and without children under age 5, in order to achieve implicit stratification on households with and without children under age 5. The households were then sequentially numbered from 1 to Mhi (the total number of households in each bagh and kheseg) at the National Statistical Office, where the selection of 25 households in each cluster was carried out using random systematic selection procedures. The MICS6 spreadsheet template for systematic random selection of households was adapted for this purpose.

The survey also included a questionnaire for individual men that was to be administered in 50 percent of the sample of households. The MICS household selection template includes an option to specify the proportion of households to be selected for administering the individual questionnaire for men, and the spreadsheet automatically selected the

corresponding subsample of households.¹ All men age 15 to 49 years in the selected households were eligible for interview.

The SISS also included water quality testing for a subsample of households within each sample cluster. A subsample of 5 of the 25 selected households was selected in each sample cluster using random systematic sampling for conducting water quality testing, for both water in the household and at the source. The MICS household selection template includes an option to specify the number of households to be selected for the water quality testing, and the spreadsheet automatically selected the corresponding subsample of households.¹

A.5 CALCULATION OF SAMPLE WEIGHTS

The SISS sample is not self-weighting, partly because different sampling fractions were used in each stratum. For this reason, sample weights were calculated and used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (*h*) and PSU (*i*):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term *f_{hi}*, the sampling probability for the *i*-th sample PSU in the *h*-th stratum, is the product of the probabilities of selection at every stage in each sampling stratum:

$$f_{hi} = p_{1hi} \times p_{2hi} \times p_{3hi},$$

where *p_shi* is the probability of selection of the sampling unit at stage *s* for the *i*-th sample PSU in the *h*-th sampling stratum. Based on the sample design, these probabilities were calculated as follows:

$$p_{1hi} = \frac{n_h \times M_{hi}}{M_h},$$

where:

- n_h* = number of sample PSUs selected in stratum *h*
- M_{hi}* = number of households in the 2017 PHR frame for the *i*-th sample PSU in stratum *h*

M_h = number of households in the 2017 PHR frame for the *i*-th sample PSU in stratum *h*

p_{2hi} = proportion of the PSU listed in the *i*-th sample PSU in stratum *h* (in the case of PSUs that were segmented); for non-segmented PSUs, *p_{2hi}* = 1

$$p_{3hi} = \frac{25}{M'_{hi}}$$

M'_{hi} = number of households listed in the *i*-th sample PSU in stratum *h*

The PPS selection in the first stage was based on the population in the PSU as measure of size, so, strictly, the calculation of the first stage weight should be based on population in the PSU. However, the calculation of the first stage probability was, as seen above, based on number of households instead of population. This way of calculating the first stage probability will introduce a slight smoothing of the sampling weights, which is beneficial for the precision.

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews. The adjustment for household non-response in each stratum is equal to:

$$\frac{1}{RR_h}$$

where *RR_h* is the response rate for the sample households in stratum *h*, defined as the proportion of the number of interviewed households in stratum *h* out of the number of selected households found to be occupied during the fieldwork in stratum *h*.

Similarly, adjustment for non-response at the individual level (women, men, and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where *RR_{qh}* is the response rate for the individual questionnaires in stratum *h*, defined as the proportion of eligible individuals (women, men, and under-5 children) in the sample households in stratum *h* who were successfully interviewed.

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used

¹ Available here: "MICS6 TOOLS." Home – UNICEF MICS. Accessed August 31, 2018. <http://mics.unicef.org/tools#survey-design>.

to adjust the sample weights calculated for each cluster. Response rates in the SISS are shown in Table SR.1.1 in this report.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

The weights for the questionnaire for individual men were calculated in a similar way. In this case the number of eligible men in the list of household members in all the SISS sample households in the stratum was used as the numerator of the non-response adjustment factor, while the number of completed questionnaires for men in the stratum was obtained from the 50 percent subsample of households. Therefore, this adjustment factor includes an implicit subsampling weighting factor of 2 in addition to the adjustment for the non-response to the individual questionnaire for men.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

For the water quality testing (both in household and at source) a subsample of 5 households was selected from the 25 SISS sample households in each sample cluster. Therefore, the basic (unadjusted) household weight would be multiplied by the inverse of this subsampling rate as follows:

$$W_{wqhi} = \frac{1}{f_{hi}} \cdot \frac{25}{5} = \frac{5}{f_{hi}},$$

where:

W_{wqhi} = basic weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h

Since the response rate may be different for the water quality testing for home consumption and at the source, the basic weights for each were adjusted separately for non-response at the stratum level as follows:

$$W'_{wqhi} = W_{wqhi} \times \frac{m_{wqh}}{m'_{wqh}}$$

where:

W'_{wqhi} = adjusted weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h (separately for water quality testing in the household and at the source)

m_{wqh} = number of valid (occupied) sample households selected for water quality testing in stratum h

m'_{wqh} = number of sample households with completed water quality testing in stratum h (separately for water quality testing in the household and at the source)

The SISS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, men, under-5 and 5-17 years old children, and water quality testing. Adjusted (normalised) household weights varied between 0.1710 and 4.2085 in the 580 sample enumeration areas (clusters).

For the eight target provinces/districts, province/district wise normalized weights for the household, individual women, men, under-5 and 5-17 years old children, and water quality testing were also calculated. These sets of weights will be used exclusively for the preparation of result tables for the Chapter 12 in which only the target province/district level figures are presented.

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, men, under-5s, 5-17-year olds and water quality testing with these sample weights.

Sample weights were appended to all data sets and analyses presented in this report were performed by weighting survey data with these sample weights.

LIST OF PERSONNEL OF THE SURVEY

STEERING COMMITTEE

HEAD:

A.Ariunzaya Chairperson, National Statistics Office Mongolia

SECRETARY:

A.Amarbal Director, Population and Social Statistical Department, NSO

MEMBERS:

L.Lkhagvasuren Senior Advisor, Standing Committee on Social Policy, Education and Science, Secretariat of the State Great Khural (Parliament)

D.Ganchimeg Senior Officer, Cabinet Secretariat

D.Gantsetseg Head, Public Health Department, Ministry of Health

S.Munkhuulei Head, Public Administration Department, Ministry of Education Culture Science and Sports

S.Tungalagtamir Head, Population Development Department, Ministry of Labour and Social Protection

N.Javkhlantugs Head, Monitoring, Evaluation and Internal Audit Department, Ministry of Justice and Home Affairs

B.Sanduijav Head, Monitoring Evaluation and Internal Audit Department, Ministry of Energy

Kh.Oyuntsetseg Senior Officer, Economic Policy Department, Ministry of Finance

L.Erdenebulgan Head, Division of Water Resources, Ministry of Environment and Tourism

B.Tsogtbaatar Director General, National Center for Public Health, Ministry of Health

J.Doljinsuren Head, Development Policy and Planning Department, National Development Agency

M.Tsenguun Head, Statistical and Information Technology Department, Center for Health Development, Ministry of Health

B.Khaliun Vice Chairperson, Authority for Family, Child and Youth Development, Ministry of Labour and Social Protection

Ch.Altangerel Executive Director of Secretariat, National Human Right Commission

D.Ariunbold Director, Division of Market Research and Analysis, Communications Regulatory Commission

ESTIMATES OF SAMPLING ERRORS

The sample of respondents selected in the Survey name Multiple Indicator Cluster Survey is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- Standard error (se): Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors. For more complex statistics, such as fertility and mortality rates, the Jackknife repeated replication method is used for standard error estimation.
- Coefficient of variation (se/r) is the ratio of the standard error to the value (r) of the indicator, and is a measure of the relative sampling error.
- Design effect (deff) is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The square root of the design effect (deff) is used to show the efficiency of the sample design in relation to the precision. A deff value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a deff value above 1.0 indicates an increase in the standard error due to the use of a more complex sample design.
- Confidence limits are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in CPro Version 5.0 and SPSS Version 23 Complex Samples module have been used.

The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators and denominators of each of these indicators are provided in Chapter III. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.3), and for all regions (Tables SE.4 to SE.8).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalized weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted count, this means that the domain had been over-sampled.

For several indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the total population living in these households.

- Access to electricity
- Primary reliance on clean fuels and technologies for cooking, space heating and lighting
- Use of basic drinking water services
- Use of safely managed drinking water services
- Handwashing facility with water and soap
- Use of basic sanitation services
- Safe disposal in situ of excreta from on-site sanitation facilities
- Population covered by social transfers

Table SE.1: Sampling errors: Total sample

Standard errors, coefficients of variation, design effects (def), square root of design effects (def), and confidence intervals for selected SDG and SISS/MICS indicators, Mongolia, 2018

SISS/MICS Indicator	Value (t)	Standard error (se)	Coefficient of variation (se/t)	Design effect (def)	Square root of design effect (def)	Weighted count	Unweighted count	Confidence limits

Children with foundational reading and number skills									
Three foundational reading tasks									
(a) Age 7-14	0.601	0.019	0.031	3.1	1.8	2,647	2,161	0.564	0.638
(b) Age for grade 2/3	0.414	0.026	0.064	1.8	1.3	743	621	0.361	0.467
Four foundational number tasks									
(d) Age 7-14	0.542	0.015	0.028	1.9	1.4	2,447	2,012	0.511	0.572

SISS/ MICS Indicator	Value (t)	Standard error (se)	Coefficient of variation (se/t)	Design effect (def)	Square root of design effect (def)	Weighted count	Unweighted count	Confidence limits	
								Lower bound $r - 2se$	Upper bound $r + 2se$
(e) Age for grade 2/3	0.342	0.021	0.062	1.1	1.0	642	548	0.300	0.384
Protected from violence and exploitation									
Birth registration	0.994	0.002	0.002	3.0	1.7	2,042	3,010	0.989	0.999
Violent discipline	0.455	0.014	0.031	4.4	2.1	5,205	5,387	0.427	0.484
Child labour	0.268	0.012	0.046	2.7	1.7	4,227	3,333	0.244	0.293
Child marriage									
Women									
(a) before age 15	0.017	0.005	0.290	0.7	0.8	282	470	0.007	0.027
(b) before age 18	0.108	0.016	0.151	1.3	1.1	282	470	0.076	0.141
Men									
(a) before age 15	0.000	0.000	0.000	na	na	148	249	0.000	0.000
(b) before age 18	0.038	0.014	0.377	1.4	1.2	148	249	0.009	0.066
Young people age 15–19 years currently married or in union									
Women	0.030	0.007	0.238	0.9	1.0	331	530	0.016	0.044
Men	0.010	0.005	0.505	0.7	0.8	167	267	0.000	0.021
Spousal age difference									
(b) among women age 20–24 years	0.025	0.006	0.249	0.5	0.7	175	289	0.012	0.037
Experience of robbery and assault (women)	0.063	0.004	0.080	1.8	1.4	3,299	5,144	0.045	0.062
Experience of robbery and assault (men)	0.062	0.007	0.130	2.1	1.5	1,511	2,291	0.038	0.065
Crime reporting (women)	0.304	0.024	0.078	0.7	0.8	175	263	0.257	0.352
Crime reporting (men)	0.254	0.032	0.124	0.5	0.7	78	99	0.191	0.317
Safety (women)	0.655	0.013	0.020	4.0	2.0	3,299	5,144	0.629	0.681
Safety (men)	0.925	0.009	0.010	2.9	1.7	1,511	2,291	0.906	0.944
Attitudes towards domestic violence (women)	0.149	0.009	0.062	3.5	1.9	3,299	5,144	0.130	0.167
Attitudes towards domestic violence (men)	0.070	0.008	0.109	2.0	1.4	1,511	2,291	0.054	0.085
Live in a safe and clean environment									
Use of improved drinking water sources	0.640	0.021	0.033	13.3	3.6	16,277	6,808	0.596	0.682
Use of basic drinking water services	0.581	0.021	0.037	12.6	3.6	16,277	6,808	0.539	0.624
Availability of drinking water	0.955	0.004	0.005	3.1	1.7	16,277	6,808	0.946	0.964
Faecal contamination of source water	0.332	0.028	0.086	8.2	2.9	2,985	1,279	0.275	0.389
Faecal contamination of household drinking water	0.303	0.021	0.070	5.1	2.3	3,150	1,346	0.261	0.346
Use of safely managed drinking water services	0.062	0.014	0.234	8.1	2.8	2,985	1,279	0.033	0.091
Handwashing facility with water and soap	0.729	0.015	0.020	7.3	2.7	16,277	6,808	0.700	0.758
Use of improved sanitation facilities	0.684	0.021	0.031	14.2	3.8	16,277	6,808	0.642	0.727
Use of improved sanitation facilities (based on country specific definition)	0.081	0.015	0.183	20.1	4.5	16,277	6,808	0.052	0.111
Use of basic sanitation services	0.497	0.019	0.039	10.1	3.2	16,277	6,808	0.458	0.536
Safe disposal in situ of excreta from on-site sanitation facilities	0.983	0.002	0.002	2.2	1.5	10,366	4,383	0.990	0.997
Removal of excreta for treatment off-site	0.004	0.001	0.294	2.3	1.5	16,277	6,808	0.002	0.006
Menstrual hygiene management	0.822	0.011	0.014	4.1	2.0	2,985	4,510	0.799	0.845
Exclusion from activities during menstruation	0.035	0.004	0.110	2.0	1.4	2,885	4,510	0.027	0.043
Equitable chance in life									
Children with functional difficulty	0.050	0.004	0.085	2.1	1.4	5,509	5,415	0.042	0.059

SISS/MICS Indicator	Value (t)	Standard error (se)	Coefficient of variation (se/t)	Design effect (deff)	Square root of design effect (deff)	Weighted count	Unweighted count	Confidence limits	
								Lower bound r - 2se	Upper bound r + 2se
Discrimination (women)	EQ.7	0.139	0.008	3.0	1.7	3,299	5,144	0.122	0.156
Discrimination (men)	EQ.7	0.122	0.010	2.1	1.4	1,511	2,291	0.102	0.142
Overall life satisfaction index (women age 15-24)									
Women									
(a) age 15-24	EQ.9a	6.825	0.098	0.014	1.9	612	997	6.629	1.000
(b) age 15-49	EQ.9b	6.965	0.046	0.007	2.4	3,294	5,133	6.873	1.000

^a Includes those tests indicating 0 ppm in first test where a second test was not performed.

Table DQ.3.2: Completeness and quality of information of water quality testing

Percentage of households selected and completed household and source water quality testing and percentage of positive blank tests by area, Mongolia, 2018										
	Percentage of households:									
	Selected for Water Quality Testing questionnaire	With completed Water Quality Testing questionnaire	With complete water quality test for: Household	Total number of households in sample	Source	Total number of households in sample	Percentage of positive blank tests	Number of blank tests completed	Number of households selected for blank test ^a	
Total	20.0	19.8	19.8	13,798	18.6	2,765	1.5	485	560	
Area										
Urban	20.1	19.8	19.8	9,235	18.5	1,853	0.9	312	374	
Capital city	20.1	19.7	19.7	6,486	18.2	1,302	1.2	209	263	
Almag center	20.0	19.9	19.9	2,749	19.3	550	0.2	103	110	
Rural	20.0	19.8	19.8	4,563	18.9	912	2.7	173	187	
Soum center bagh	20.2	20.1	20.1	1,886	19.3	381	2.9	72	78	
Rural bagh	19.8	19.5	19.5	2,677	18.6	531	2.6	101	108	

^a One blank test (a test of uncontaminated water) was designed to be performed in each cluster. For practical reasons, the blank test was assigned to one of the households selected for water quality testing.

Table DQ.3.3W: Completeness of information on dates of marriage/union and sexual intercourse (women)		
Percentage of women age 15–49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Mongolia, 2018		
	Percent with missing/ incomplete information ^A	Number of women
Ever married (age 15–49 years)		
Date of first marriage/union missing	7.1	8,640
Only month missing	6.0	8,640
Both month and year missing	1.0	8,640
Age at first marriage/union missing	0.1	8,640
Ever had sex (age 15–49 years)		
Age at first intercourse missing	5.7	9,513
Time since last intercourse missing	0.4	9,513
Ever had sex (age 15–24 years)		
Age at first intercourse missing	3.2	1,163
Time since last intercourse missing	0.6	1,163

^A Includes "Don't know" responses.

Table DQ.3.3M: Completeness of information on dates of marriage/union and sexual intercourse (men)		
Percentage of men age 15–49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Mongolia, 2018		
	Percent with missing/ incomplete information ^A	Number of men
Ever married (age 15–49 years)		
Date of first marriage/union missing	5.3	3,208
Only month missing	4.1	3,208
Both month and year missing	1.2	3,208
Age at first marriage/union missing	0.0	3,208
Ever had sex (age 15–49 years)		
Age at first intercourse missing	0.1	4,008
Time since last intercourse missing	0.3	4,008
Ever had sex (age 15–24 years)		
Age at first intercourse missing	0.1	612
Time since last intercourse missing	0.1	612

^A Includes "Don't know" responses.

QUESTIONNAIRES

HOUSEHOLD QUESTIONNAIRE
Social Indicator Sample Survey 2018

HOUSEHOLD INFORMATION PANEL		HH	
HH1. Cluster Number: _____		HH2. Household Number: _____	
HH3. Interviewer's name and number: NAME _____		HH4. Supervisor's name and number: NAME _____	
HH5. Interview Date (year/ month/ day): 2 0 1 8 / ___ / ___		HH7. Region: WESTERN 1 KHANGAI 2 CENTRAL 3 EASTERN 4 ULAANBAATAR 5	
HH6. Location: CAPITAL CITY 1 AIMAG CENTER 2 SOU M CENTER 3 RURAL AREA 4		HH8. Is the household selected for Questionnaire for Men? YES 1 NO 2	
HH9. Is the household selected for Water Quality Testing? YES 1 NO 2		HH10. Is the household selected for blank testing? YES 1 NO 2	

<p>Check that the respondent is a knowledgeable member of the household and at least 18 years old before proceeding. You may only interview a child age 15-17 if there is no adult member of the household or all adult members are incapacitated. You may not interview a child under age 15.</p>	HH11. Record the time
	HOURS : MINUTES :
<p>HH12. Hello. My name is (your name). I am working with the National statistics office. We are conducting a survey on the situation of children, families, and households. I would like to talk with you regarding these issues. This interview will take about 20 minutes. We might then interview other members of your household. The information you provide to us will remain confidential as per clause 4 of article 5 of the law of Mongolia on personal secrets and clause 3 of article 22 of the law on statistics. This information will only be used anonymously for analysis of the survey results. If you don't want to answer a question or if you want to stop the interview, just let me know. Can we start the interview now?</p>	
YES 1	1 ⇒ LIST OF HOUSEHOLD MEMBERS
NO / NOT ASKED 2	2 ⇒ HH46

<p>HH46. Result of Household Questionnaire interview: Discuss any result not completed with Supervisor.</p>	COMPLETED 01
	NO HOUSEHOLD MEMBER AT HOME OR NO COMPETENT RESPONDENT AT HOME AT TIME OF VISIT 02
	ENTIRE HOUSEHOLD ABSENT FOR EXTENDED PERIOD OF TIME 03
	REFUSED 04
	DWELLING VACANT OR ADDRESS NOT A DWELLING 05
	DWELLING DESTROYED 06
	DWELLING NOT FOUND 07

FL2. Record the time.	HOURS AND MINUTES :	
<p>FL3. I am (<i>your name</i>).</p> <p>What is your name? Could you tell me a little bit about yourself?</p> <p><i>When the child is comfortable, continue with the verbal consent.</i></p> <p>Let me tell you why I am here today. I am from National Statistical Office. I am part of a team trying to find out how children are learning to read and to use numbers. We are also talking to some of the children about this and asking them to do some reading and number activities. (Your mother/<i>Name of caretaker</i>) has said that you can decide if you want to help us. If you wish to help us, I will ask you some questions and give you some activities to do. I will explain each activity, and you can ask me questions any time. You do not have to do anything that you do not want to do. After we begin, if you do not want to answer a question or you do not want to continue that is alright.</p>		
Are you ready to get started?	YES.....1 NO / NOT ASKED2	2 ⇒FL28

<p>FL4. Before you start with the reading and number activities, tick each box to show that:</p> <p><input type="checkbox"/> You are not alone with the child unless they are at least visible to an adult known to the child.</p> <p><input type="checkbox"/> You have engaged the child in conversation and built rapport, e.g. using an Icebreaker.</p> <p><input type="checkbox"/> The child is sat comfortably, able to use the READING & NUMBERS Book without difficulty while you can see which page is open.</p>		
FL5. Remember you can ask me a question at any time if there is something you do not understand. You can ask me to stop at any time.		
FL6. Let's start talking about reading?	YES NO	
[A] Do you read books at home?	READ BOOKS AT HOME1 2	
[B] Does someone read to you at home?	READ TO AT HOME1 2	
FL7. Which language do you speak most of the time at home?	MONGOLIAN..... 1 KAZAKH 2 TUVA 3 OTHER (<i>specify</i>) 6 DK 8	
<i>Probe if necessary and read the listed languages.</i>		

<p>FL8. Check CB7: In the current school year, did the child attend school or any early childhood education programme?</p> <p>Check ED9 in the EDUCATION Module in the HOUSEHOLD QUESTIONNAIRE for child if CB7 was not asked.</p>	<p>YES, CB7/ED9=1..... 1 NO, CB7/ED9=2 OR BLANK 2</p>	<p>1 ⇒FL9A</p>
<p>FL8A. Check CB4: Did the child ever attend school or any early childhood education programmes?</p> <p>Check ED4 in the EDUCATION Module in the HOUSEHOLD QUESTIONNAIRE for child if CB4 was not asked.</p>	<p>YES, CB4/ED4=1..... 1 NO, CB4/ED4=2 OR BLANK 2</p>	<p>1 ⇒FL9B</p>
<p>FL8B. Check FL7: Are READING & NUMBERS Book available in the language spoken at home or not?</p>	<p>YES, FL7=1, 2..... 1 NO, FL7=3, 6, 8..... 2</p>	<p>1 ⇒FL10B 2 ⇒FL23</p>
<p>FL9A. What language do your teachers use most of the time when teaching you in class?</p> <p>FL9B. When you were in school, what language did your teachers use most of the time when teaching you in class?</p> <p>Probe if necessary and name the listed languages.</p>	<p>MONGOLIAN..... 1 KAZAKH 2</p> <p>OTHER (specify) _____ 6 DK 8</p>	<p>1 ⇒FL10A 2 ⇒FL10A 6 ⇒FL23 8 ⇒FL23</p>
<p>FL10A. Now I am going to give you a short story to read in (Language recorded in FL9A/B). Would you like to start reading the story?</p> <p>FL10B. Now I am going to give you a short story to read in (Language recorded in FL7). Would you like to start reading the story?</p>	<p>YES 1 NO 2</p>	<p>2 ⇒FL23</p>
<p>FL11. Check CB3: Child's age?</p>	<p>AGE 7-9 YEARS..... 1 AGE 10-14 YEARS..... 2</p>	<p>1 ⇒FL13</p>
<p>FL12. Check CB7: In the current school year, did the child attend school or any early childhood education programme?</p> <p>Check ED9 in the EDUCATION Module in the HOUSEHOLD QUESTIONNAIRE for child if CB7 was not asked.</p>	<p>YES, CB7/ED9=1..... 1 NO, CB7/ED9=2 OR BLANK 2</p>	<p>1 ⇒FL19</p>
<p>FL13. Give the child the READING & NUMBERS Book.</p> <p>Open the page showing the reading practice item and say:</p> <p>Now we are going to do some reading. <i>Point to the sentence.</i> I would like you to read this aloud. Then I may ask you a question.</p> <p><i>Muujgai is a cat. Banhar is a dog. Muujgai is 5. Banhar is 6.</i></p>		
<p>FL14. Did the child read every word in the practice correctly?</p>	<p>YES..... 1 NO..... 2</p>	<p>2 ⇒FL23</p>
<p>FL15. Once the reading is done, ask: How old is Muujgai?</p>	<p>MUUGAI IS 5 YEARS OLD..... 1 OTHER ANSWERS 2 DID NOT ANSWER WITHIN 5 SECOND 3</p>	<p>1 ⇒FL17</p>
<p>FL16. Say: Muujgai is 5 years old. and go to FL23.</p>		<p>⇒FL23</p>

FL17. Here is another question: Who is older: Is it Muujgai or Banhar?	BANHAR IS OLDER (THAN MUUJGAI) 1 OTHER ANSWERS 2 DID NOT ANSWER WITHIN 5 SECONDS..... 3	1 ⇒ <i>FL19</i>
FL18. <i>Say:</i> Banhar is older than Muujgai. Banhar is 6 and Muujgai is 5. <i>and go to FL23.</i>		⇒ <i>FL23</i>

<p>FL19. Turn the page to reveal the reading passage.</p> <p>Thank you. Now I want you to try this.</p> <p>Here is a story. I want you to read it aloud as carefully as you can.</p> <p>You will start here (point to the first word on the first line) and you will read line by line (point to the direction for reading each line).</p> <p>When you finish I will ask you some questions about what you have read.</p> <p>If you come to a word you do not know, go onto the next word.</p> <p>Put your finger on the first word. Ready? Begin.</p>	On	the	way	back	home.	Misheel
	1	2	3	4	5	6
	likes	flowers.	One	day,	on	the
	7	8	9	10	11	12
	way	from	school	she	saw	yellow
	13	14	15	16	17	18
	flowers	growing	behind	the	potato	field
	19	20	21	22	23	24
	She	wanted	to	give	flowers	to
	25	26	27	28	29	30
	her	mother	before	the	flowers	fall
	31	32	33	34	35	36
	off	in	Autumn.	Misheel	ran	fast
	37	38	39	40	41	42
	alongside	the	field	to	pick	up
	43	44	45	46	47	48
	flowers.	She	stumbled	over	a	large
	49	50	51	52	53	54
	stone	near	the	field.	Having	heard
	55	56	57	58	59	60
the	girl	crying,	a	farmer	came	
61	62	63	64	65	66	
to	her.	The	farmer	consoled	her

by	giving	her	flowers.	She	was	
73	74	75	76	77	78	
delighted	and	ran	home	happily.		
79	80	81	82	83		
<p>FL20. Result of the child reading:</p>	LAST WORD ATTEMPTED.....NUMBER ___					
	TOTAL NUMBER OF WORDS INCORRECT OR MISSEDNUMBER ___					
<p>FL21. How well did the child read the story?</p>	THE CHILD READ AT LEAST ONE WORD CORRECTLY1					
	THE CHILD DID NOT READ ANY WORD CORRECTLY2					2 ⇒ FL23
	THE CHILD DID NOT TRY TO READ THE STORY.....3					3 ⇒ FL23

<p>FL22. Now I am going to ask you a few questions about what you have read.</p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark 'No response' and say: Thank you. That is ok. We will move on.</i></p> <p>Thank you. Let's start next exercise.</p> <p><i>Make sure the child can still see the passage and ask</i></p> <p>[A] What does Misheel like?</p> <p>[B] What did Misheel see on the way from school?</p> <p>[C] Why did Misheel start crying?</p> <p>[D] Where did Misheel fall (down)?</p> <p>[E] Why was Misheel happy?</p>	<p>CORRECT (MISHEEL LIKES FLOWERS)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (SHE SAW YELLOW FLOWERS) 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (BECAUSE SHE STUMBLED)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (SHE FELL NEAR FIELD)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p> <p>CORRECT (BECAUSE A FARMER GAVE FLOWER TO HER. / BECAUSE SHE GOT FLOWERS FOR HER MOTHER)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW' 3</p>	
<p>FL23. Turn the page in the <i>READING & NUMBERS Book</i> so the child is looking at the list of numbers. Make sure the child is looking at this page.</p> <p>Now here are some numbers. I want you to point to each number and tell me what the number is.</p> <p><i>Point to the first number and say:</i></p> <p>Start here.</p> <p><i>If the child stops on a number for a while, tell the child what the number is, mark the number as 'No Attempt', point to the next number and say:</i></p> <p>What is this number?</p> <p>STOP RULE <i>If the child does not attempt to read 2 consecutive numbers, say:</i></p> <p>Thank you. Let's start next exercise.</p>	<p>9 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>12 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>30 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>48 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>74 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>731 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL23A. Check FL23: Did the child correctly identify two of the first three numbers (9, 12 and 30)?</p>	<p>YES, AT LEAST TWO CORRECT 1 NO, AT LEAST 2 INCORRECT OR WITH NO ATTEMPT 2</p>	<p>2 ⇒ FL28</p>

<p>FL24. Turn the page so the child is looking at the first pair of numbers. Make sure the child is looking at this page. Say:</p> <p>Look at these numbers. Tell me which one is bigger.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next pair of numbers.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark a 'Z' for the answer on the appropriate row on the questionnaire, turn the booklet page and show the child the next pair of numbers.</p> <p>If the child does not attempt 2 consecutive pairs, say:</p> <p>Thank you. That is ok. We will go to the next exercise.</p>	<p>7 5 _____</p> <p>11 24 _____</p> <p>58 49 _____</p> <p>65 67 _____</p> <p>146 154 _____</p>	
<p>FL25. Give the child a pencil and paper. Turn the page so the child is looking at the first addition. Make sure the child is looking at this page. Say:</p> <p>Look at this sum. How much is (number plus number)? Tell me the answer. You can use the pencil and paper if it helps you.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next sum.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark a 'Z' for the answer on the appropriate row on the questionnaire, turn the booklet page and show the child the next addition.</p> <p>If the child does not attempt 2 consecutive pairs, say:</p> <p>Thank you. That is ok. We will go to the next exercise.</p>	<p>3 + 2 = _____</p> <p>8 + 6 = _____</p> <p>7 + 3 = _____</p> <p>13 + 6 = _____</p> <p>12 + 24 = _____</p>	
<p>FL26. Turn the page to the practice sheet for missing numbers. Say:</p> <p>Here are some numbers. 1, 2, and 4. What number goes here?</p> <p>If the child answers correctly say:</p> <p>That's correct, 3. Let's do another one.</p> <p>If the child answers incorrectly, do not explain the child how to get the correct answer. Just say:</p> <p>The number 3 goes here. Say the numbers with me. (Point to each number) 1, 2, 3, 4. 3 goes here. Let's do another one.</p> <p>Now turn the page to the next practice sheet. Say:</p> <p>Here are some more numbers. 5, 10, 15 and _____. What number goes here?</p> <p>If the child answers correctly say:</p> <p>If the child answers correctly say:</p> <p>If the child answers incorrectly say:</p> <p>The number 20 goes here. Say the numbers with me. (Point to each number) 5, 10, 15, 20. 20 goes here. Now I want you to try this on your own.</p>		

<p>FL27. Now turn the page in the <i>READING & NUMBERS Book</i> with the first missing number activity. Say:</p> <p>Here are some more numbers. Tell me what number goes here (<i>pointing to the missing number</i>).</p> <p><i>Record the child's answer before turning the page in the book and repeating the question.</i></p> <p><i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark a 'Z' for the answer on the appropriate row on the questionnaire.</i></p> <p><i>If the child does not attempt 2 consecutive activities, say:</i></p> <p>Thank you. That is ok.</p>	<p>5 6 7 ___</p> <p>14 15 ___ 17</p> <p>20 ___ 40 50</p> <p>2 4 6 ___</p> <p>5 8 11 ___</p>

EC15. Does (<i>name</i>) get distracted easily?	YES.....1 NO.....2 DK.....8	

CHILD DISCIPLINE		UCD
UCD1. Check UB2: Child's age?	AGE 0..... 1 AGE 1, 2, 3 OR 4 2	1 ⇒ End
UCD2. Adults use certain ways to teach children the right behaviour or to address a behaviour problem. I will read various methods that are used. Please tell me if <u>you or any other adult in your household</u> has used this method with <i>(name)</i> <u>in the past month</u> .	YES NO	
[A] Took away privileges, forbade something <i>(name)</i> liked or did not allow (him/her) to leave the house.	TOOK AWAY PRIVILEGES.....1 2	
[B] Explained why <i>(name)</i> 's behaviour was wrong.	EXPLAINED WRONG BEHAVIOR1 2	
[C] Shook (him/her)?	SHOOK HIM/HER1 2	
[D] Shouted, yelled at or screamed at (him/her).	SHOUTED, YELLED, SCREAMED1 2	
[E] Gave (him/her) something else to do.	GAVE SOMETHING ELSE TO DO1 2	
[F] Spanked, hit or slapped (him/her) on the bottom with bare hand.	SPANKED, HIT, SLAPPED ON BOTTOM WITH BARE HAND1 2	
[G] Hit (him/her) on the bottom or elsewhere on the body with something like a belt, hairbrush, stick or other hard object.	HIT WITH BELT, HAIRBRUSH, STICK OR OTHER HARD OBJECT1 2	
[H] Called (him/her) dumb, lazy or another name like that.	CALLED DUMB, LAZY OR ANOTHER NAME1 2	
[I] Hit or slapped (him/her) on the face, head or ears.	HIT / SLAPPED ON THE FACE, HEAD OR EARS1 2	
[J] Hit or slapped (him/her) on the hand, arm, or leg.	HIT / SLAPPED ON HAND, ARM OR LEG1 2	
[K] Beat (him/her) up, that is hit him/her over and over as hard as one could.	BEAT UP, HIT OVER AND OVER AS HARD AS ONE COULD1 2	
UCD3. Check UF4: Is this respondent the mother or caretaker of any other children under age 5 or a child age 5-14 selected for the questionnaire for children age 5-17?	YES 1 NO 2	2 ⇒UCD5
UCD4. Check UF4: Has this respondent already responded to the following question (UCD5 or FCD5) for another child?	YES 1 NO 2	1 ⇒ End
UCD5. Do you believe that in order to bring up, raise, or educate a child properly, the child needs to be physically punished?	YES 1 NO 2 DK/ NO OPINION 8	

CHILD FUNCTIONING		UCF
UCF1. Check UB2: Child's age?	AGE 0 OR 11 AGE 2, 3 OR 42	1⇒End
UCF2. I would like to ask you some questions about difficulties (<i>name</i>) may have. Does (<i>name</i>) wear eyeglasses?	YES.....1 NO2	
UCF3. Does (<i>name</i>) use a hearing aid?	YES.....1 NO2	
UCF4. Does (<i>name</i>) use any equipment or receive assistance for walking?	YES.....1 NO2	
UCF5. In the following questions, I will ask you to answer by selecting one of four possible answers. For each question, would you say that (<i>name</i>) has: 1) no difficulty, 2) some difficulty, 3) a lot of difficulty, or 4) that (he/she) cannot at all. <i>Repeat the categories during the individual questions whenever the respondent does not use an answer category:</i> Remember the four possible answers: Would you say that (<i>name</i>) has: 1) no difficulty, 2) some difficulty, 3) a lot of difficulty, or 4) that (he/she) cannot at all?		
UCF6. Check UCF2: Child wears eyeglasses?	YES, UCF2=11 NO, UCF2=22	1⇒UCF7A 2⇒UCF7B
UCF7A. When wearing (his/her) eyeglasses, does (<i>name</i>) have difficulty seeing? UCF7B. Does (<i>name</i>) have difficulty seeing?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT SEE AT ALL4	
UCF8. Check UCF3: Child uses a hearing aid?	YES, UCF3=11 NO, UCF3=22	1⇒UCF9A 2⇒UCF9B
UCF9A. When using (his/her) hearing aid(s), does (<i>name</i>) have difficulty hearing? For example, hearing people's voices, talking or music? UCF9B. Does (<i>name</i>) have difficulty hearing? For example, hearing people's voices, talking or music?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY..... 3 CANNOT HEAR AT ALL.....4	
UCF10. Check UCF4: Child uses equipment or receives assistance for walking?	YES, UCF4=11 NO, UCF4=22	1⇒UCF11 2⇒UCF13
UCF11. Without (his/her) equipment or assistance, does (<i>name</i>) have difficulty walking?	SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT WALK AT ALL.....4	
UCF12. With (<i>name's</i>) equipment or assistance, does (<i>he/she</i>) have difficulty walking?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT WALK AT ALL.....4	1⇒UCF14 2⇒UCF14 3⇒UCF14 4⇒UCF14
UCF13. Compared with children of the same age, does (<i>name</i>) have difficulty walking?	NO DIFFICULTY1 SOME DIFFICULTY2 A LOT OF DIFFICULTY3 CANNOT WALK AT ALL.....4	

<p>UCF14. Compared with children of the same age, does (<i>name</i>) have difficulty picking up small objects with (his/her) hand?</p>	<p>NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT PICK UP AT ALL 4</p>	
<p>UCF15. Does (<i>name</i>) have difficulty understanding you?</p>	<p>NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT UNDERSTAND AT ALL 4</p>	
<p>UCF16. When (<i>name</i>) speaks, do you have difficulty understanding (him/her)?</p>	<p>NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT UNDERSTAND AT ALL 4</p>	
<p>UCF17. Compared with children of the same age, does (<i>name</i>) have difficulty learning things?</p>	<p>NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT LEARN THINGS AT ALL 4</p>	
<p>UCF18. Compared with children of the same age, does (<i>name</i>) have difficulty playing?</p>	<p>NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT PLAY AT ALL 4</p>	
<p>UCF19. The next question has five different options for answers. I am going to read these to you after the question.</p> <p>Compared with children of the same age, how much does (<i>name</i>) kick, bite or hit other children or adults?</p> <p>Would you say: not at all, less, the same, more or a lot more?</p>	<p>NOT AT ALL 1 LESS 2 THE SAME 3 MORE 4 A LOT MORE 5</p>	

BREASTFEEDING AND DIETARY INTAKE		BD		
BD1. Check UB2: Child's age?	AGE 0, 1, OR 2 1 AGE 3 OR 4 2	2 ⇒ End		
BD2. Does (<i>name</i>) ever breastfed?	YES 1 NO 2 DK 8	2 ⇒ BD3A 8 ⇒ BD3A		
BD3. Is (<i>name</i>) being breastfed now?	YES 1 NO 2 DK 8			
BD3A. Check UB2: Child's age?	AGE 0 OR 1 1 AGE 2 2	2 ⇒ End		
BD4. Yesterday, during the day or night, did (<i>name</i>) <u>drink anything from a bottle with a nipple</u> ?	YES 1 NO 2 DK 8			
BD5. Did (<i>name</i>) drink <u>Oral Rehydration Salt Solution (ORS)</u> yesterday?	YES 1 NO 2 DK 8			
BD6. Did (<i>name</i>) <u>drink or eat vitamin or mineral supplements or any medicines</u> yesterday, during the day or night?	YES 1 NO 2 DK 8			
BD7. Now I would like to ask you about all other liquids that (<i>name</i>) may have had yesterday during the day or the night. It could be any liquid (<i>name</i>) had with meal or drank separately. It can also include liquids consumed outside of your home. Did (<i>name</i>) drink (<i>name of item</i>) yesterday during the day or night?		YES	NO	DK
[A] Plain water?	PLAIN WATER	1	2	8
[B] Juice or juice drinks?	JUICE OR JUICE DRINKS	1	2	8
[C] Broth?	CLEAR BROTH	1	2	8
[D] Infant formula such as Hai Hai, Nan, Humana, Milasan, Nutrilon etc.?	INFANT FORMULA	1	2 ☹ BD7[E]	8 ☹ BD7[E]
[D1] How many times did (<i>name</i>) drink infant formula? <i>If 7 or more times, record '7'. If unknown, record '8'.</i>	NUMBER OF TIMES FED BY INFANT FORMULA	_____		
[E] Milk from animals, such as fresh, tinned, or powdered milk?	MILK	1	2 ☹ BD7[X]	8 ☹ BD7[X]
[E1] How many times did (<i>name</i>) drink milk? <i>If 7 or more times, record '7'. If unknown, record '8'.</i>	NUMBER OF TIMES DRANK MILK	_____		
[X] Any other liquids?	LIQUID EXCEPT THE ABOVE MENTIONED ONES	1	2 ☹ BD8	8 ☹ BD8
[X1] Record all other liquids mentioned.	(Specify) _____			

<p>BD8. Now I would like to ask you about <u>everything</u> that (name) ate yesterday during the day or the night. Please include foods consumed outside of your home.</p> <p>- Think about when (name) woke up yesterday. Did (he/she) eat anything at that time? If 'Yes' ask: Please tell me everything (name) ate at that time. Probe: Anything else? Record answers using the food groups below.</p> <p>- What did (name) do after that? Did (he/she) eat anything at that time? Repeat this string of questions, recording in the food groups, until the respondent tells you that the child went to sleep until the next morning.</p>				
<p>For each food group not mentioned after completing the above ask:</p> <p>Just to make sure, did (name) eat (food group items) yesterday during the day or the night?</p>				
		YES	NO	DK
[A] Yogurt made from animal milk? Please pay attention, that depending on the milk content, liquid yogurt should be recorded in question BD7[E] or BD7[X].	YOGURT	1	2 ² _{BD8[B]}	8 ⁸ _{BD8[B]}
[A1] How many times did (name) eat yogurt? If 7 or more times, record '7'. If unknown, record '8'.	TIMES			__
[B] Any baby food, such as Gerber, Humana, Wakodo, Fruto Nyanya, Agusha?	FORTIFIED CHILD FOOD	1	2	8
[C] Bread, rice, noodles, porridge, or other foods made from grains?	BREAD, RICE, PORRIDGE, NOODLES ETC. FOODS MADE FROM GRAIN	1	2	8
[D] Pumpkin, carrots, squash, or sweet potatoes that are yellow or orange inside?	CARROTS, PUMPKIN, SWEET POTATO, YELLOW MASHED FOOD	1	2	8
[E] White and red radish or any other white color vegetables?	WHITE RADDISH, RED RADISH, AND OTHER WHITE VEGETABLES	1	2	8
[F] Any dark green, leafy vegetables, such as broccoli, spinach?	BROCCOLI, SPINACH ETC. GREEN, LEAFY VEGETABLES	1	2	8
[G] Watermelon, orange and ripe mango?	WATERMELON, ORGANGE, MANGO	1	2	8
[H] Any other fruits, vegetable other than the mentioned above?	OTHER FRUITS OR VEGETABLES	1	2	8
[I] Intestines (liver, kidney, heart, other organ meats)?	INTESTINE	1	2	8
[J] Any other meat, such as pork, beef, poultry, lamb, goat or sausages made from these meats?	OTHER MEATS	1	2	8
[K] Eggs?	EGGS	1	2	8
[L] Fish or shellfish, either fresh or dried?	FRESH OR DRIED FISH	1	2	8
[M] Beans, peas or nuts, including food products made from these?	PRODUCTS FROM BEANS, PEAS, NUTS	1	2	8
[N] Cheese, curds and other diary product?	CHEESE, CURDS AN OTHER DIARY PRODUCTS	1	2	8
[X] Other solid, semi-solid or soft food?	OTHER SOLID, SEMI-SOLID OR SOFT FOOD	1	2 ² _{BD9}	8 ⁸ _{BD9}
[X1] Record any other solid, semi-solid, or soft food that are not reflected in the above food types.	(Specify) _____			

<p>BD9. How many times did (<i>name</i>) eat any solid, semi-solid or soft foods yesterday during the day or night?</p> <p><i>If BD8[A] is 'Yes', ensure that the response here includes the number of times recorded for yogurt in BD8[A1].</i></p> <p><i>If 7 or more times, record '7'.</i></p>	<p>NUMBER OF TIMES..... _</p> <p>DK..... 8</p>

IMMUNISATION						IM			
IM1. Check UB2: Child's age?		AGE 0, 1, OR 2 1				2 ⇒ End			
		AGE 3 OR 4 2							
IM2. Do you have a Mother and child health book (pink book) or Vaccination Card or any other document where that (name) vaccinations are written down?		YES, HAVE VACCINATION CARD OR A MOTHER AND CHILD HEALTH BOOK ONLY 1				1 ⇒ IM5			
		YES, HAVE OTHER DOCUMENT ONLY 2							
		YES, HAVE MORE THAN ONE DOCUMENT (INCLUDING VACCINATION CARD OR A MOTHER AND CHILD HEALTH BOOK) 3				3 ⇒ IM5			
		NO, DO NOT HAVE ANY DOCUMENT 4							
IM3. Did you ever have a Mother and Child Health handbook or Vaccination Card from a private health provider for (name)?		YES 1							
		NO 2							
IM4. Check IM2:		HAS ONLY OTHER DOCUMENT, IM2=2 1							
		HAS NO CARDS AND NO OTHER DOCUMENT AVAILABLE, IM2=4 2				2 ⇒ IM11			
IM5. May I see the (name)'s Mother and Child Health handbook, vaccination card or any other document?		YES, ONLY CARD(S) SEEN 1							
		YES, ONLY OTHER DOCUMENT SEEN 2							
		YES, CARD(S) AND OTHER DOCUMENT SEEN. 3							
		NO CARDS AND NO OTHER DOCUMENT SEEN 4				4 ⇒ IM11			
IM6.		DATE OF IMMUNISATION							
a) Copy the dates for each type of immunization dose recorded on the Immunization card/ maternal and child health handbook:		YEAR		MONTH		DAY			
b) If the card/ maternal and child health handbook shows that a vaccination was administered but the date is not recorded, record '4444' in the "year" column.									
BCG	BCG								
HepB (at birth)	HepB0								
Polio (OPV) (at birth)	OPV0								
Polio (OPV) 1	OPV1								
Polio (OPV) 2	OPV2								
Polio (OPV) 3	OPV3								
Pentavalent (DPTHibHepB) 1	Penta1								
Pentavalent (DPTHibHepB) 2	Penta2								
Pentavalent (DPTHibHepB) 3	Penta3								
MMR 1	MMR1								
MMR 2	MMR2								
HepA 1	HepA1								
HepA 2	HepA2								
IM7. Check IM6: Are all vaccines BCG to HepA2 recorded?		YES 1				1 ⇒ End			
		NO 2							

IM8. Did (<i>Name</i>) participate in 10 days Vaccination Campaign? For example:		
[A] Vaccination Days in May	MAY VACCINATION DAYS 1 2 8	
[B] Vaccination Days in October	OCTOBER VACCINATION DAYS 1 2 8	
IM9. If (<i>name</i>) received any other vaccines including vaccinations received during the vaccination days just mentioned except those recorded in the document?	YES 1 NO 2 DK 8	2 ⇒ End 8 ⇒ End
IM10. Go back to IM6 and probe for these vaccinations. Record '6666' in the corresponding year column for each vaccine received. For vaccinations <u>not</u> received record '0000'. When <u>finished</u> , go to End of module.		⇒ End
IM11. Has (<i>name</i>) ever received any vaccinations to prevent (him/her) from getting diseases, including vaccinations received in a campaign, immunisation day or Child Health Day?	YES 1 NO 2 DK 8	
IM12. Did (<i>Name</i>) participate in any 10 days Vaccination Campaign? For example:		
[A] Vaccination Days in May	MAY VACCINATION DAYS 1 2 8	
[B] Vaccination Days in October	OCTOBER VACCINATION DAYS 1 2 8	
IM13. Check IM11 and IM12:	ALL NO OR DK 1 AT LEAST ONE YES 2	1 ⇒ End
IM14. Has (<i>name</i>) ever received a BCG vaccination against tuberculosis – that is, an injection in the arm or shoulder that usually causes a scar?	YES 1 NO 2 DK 8	
IM15. Did (<i>name</i>) receive a Hepatitis B vaccination – that is an injection on the outside of the thigh to prevent Hepatitis B disease – within the first 24 hours after birth?	YES WITHIN 24 HOURS 1 YES, BUT NOT WITHIN 24 HOURS 2 NO 3 DK 8	
IM16. Has (<i>name</i>) ever received any vaccination drops in the mouth to protect (him/her) from polio? <i>Probe by indicating that the first drop is usually given at birth and later at the same time as injections to prevent other diseases.</i>	YES 1 NO 2 DK 8	2 ⇒ IM20 8 ⇒ IM20
IM17. Were the first polio drops received in the first two weeks after birth?	YES 1 NO 2 DK 8	
IM18. How many times were the polio drops received?	TIMES DK 8	
IM20. Has (<i>name</i>) ever received a Pentavalent vaccination – that is, an injection in the thigh to prevent (him/her) from getting tetanus, whooping cough, diphtheria, Hepatitis B disease, and Haemophilus influenzae type b?	YES 1 NO 2 DK 8	2 ⇒ IM26 8 ⇒ IM26

<p><i>Probe by indicating that Pentavalent vaccination is sometimes given at the same time as the polio drops.</i></p>		
<p>IM21. How many times was the Pentavalent vaccine received?</p>	<p>NUMBER OF TIMES__ DK8</p>	
<p>IM26. Has (<i>name</i>) ever received a MMR vaccine – that is, a shot in the arm at the age of 9 months or older - to prevent (him/her) from getting measles, mumps and rubella?</p>	<p>YES1 NO2 DK8</p>	<p>2 ⇒IM28A 8 ⇒IM28A</p>
<p>IM26A. How many times was the measles, mumps and rubella vaccine received?</p>	<p>NUMBER OF TIMES__ DK8</p>	
<p>IM28A. Has (<i>name</i>) received HepA vaccine that is a shot in the arm at the age of 14 months and older to prevent from hepatitis A (infectious hepatitis)?</p>	<p>YES1 NO2 DK8</p>	<p>2 ⇒IM28 8 ⇒IM28</p>
<p>IM28B. How many times was the vaccine HepA received?</p>	<p>TIMES__ DK8</p>	
<p>IM28. Issue a <i>QUESTIONNAIRE FORM FOR VACCINATION RECORDS AT HEALTH FACILITY</i> for this child. Complete the Information Panel on that <i>Questionnaire</i></p>		

CARE OF ILLNESS		CA
CA1. In the last two weeks, has (<i>name</i>) had diarrhoea?	YES1 NO2 DK8	2 ⇒CA14 8 ⇒CA14
CA2. Check BD3: Is child still breastfeeding?	YES OR BLANK, BD3=1 OR BLANK1 NO OR DK, BD3=2 OR 8.....2	1 ⇒CA3A 2 ⇒CA3B
CA3A. I would like to know how much (<i>name</i>) was given to drink during the diarrhoea. This includes breastmilk, Oral Rehydration Salt solution (ORS) and other liquids given with medicine. During the time (<i>name</i>) had diarrhoea, was (he/she) given less than usual to drink, about the same amount, or more than usual? <i>If 'less', probe:</i> Was (he/she) given much less than usual to drink, or somewhat less?	MUCH LESS.....1 SOMEWHAT LESS.....2 ABOUT THE SAME3 MORE4 NOTHING TO DRINK.....5 DK8	
CA3B. I would like to know how much (<i>name</i>) was given to drink during the diarrhoea. This includes Oral Rehydration Salt solution (ORS) and other liquids given with medicine.
