

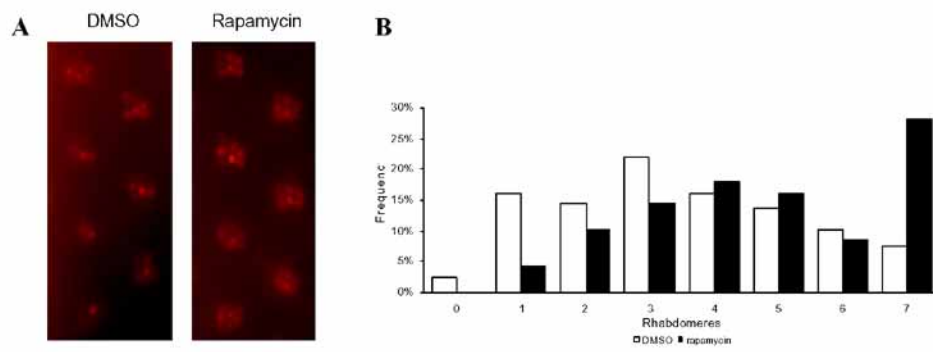

Figure 11

Supplementary figure 11

Rapamycin reduces polyglutamine-induced neurodegeneration in *Drosophila*.

Photographs of ommatidia of HD 120Q flies at 3 days post-eclosion treated with DMSO (control) or rapamycin show more rhabdomeres in the ommatidia of flies treated with rapamycin. Quantification of the frequency of ommatidia with different numbers of visible rhabdomeres shows that rapamycin treatment dramatically increases the numbers of ommatidia in the HD 120Q flies at 3 days post-eclosion.
