Supplementary Figure 1 | Neuronal culture screening results.
Results from the neuronal culture screen. The inverse of the fluorescence half decay time (stimulus, 10 action potentials) is plotted versus peak $\Delta F/F_0$ (stimulus, 1 action potential) for GCaMP3, 5G, 6s, 6m, 6f, OGB1 and 442 other GCaMP variants. The symbol color represents the inverse p-value for $\Delta F/F_0$ (1 action potential) (relative to GCaMP3). The symbol area is proportional to the normalized basal fluorescence (F_0) (relative to GCaMP3).

Bottom, z-projection of an image stack from an HuC:Gal4FF/UAS:GCaMP6s expressing larva showing mosaic expression in the neuropil (dashed yellow line) and tectal somata. *Nacre* (*mitfa-/-*) or *casper* (*mitfa-/-,roy-/-*) zebrafish[65,66] were maintained under standard conditions at 28°C and a 14:10 hour light:dark cycle[67] and larvae were raised in E3 embryo medium (5 mM NaCl, 0.17 mM KCl, 0.33 mM $CaCl_2$ and 0.33 mM $MgSO_4$). To obtain mosaic expression of GCaMP variants, embryos were injected at the 1-2 cell stage with 12 ng/μL plasmid DNA encoding Gal4FF[68] under the control of the pan-neuronal elavl3/HuC promoter (elavl3:Gal4FF), 8 ng/μL plasmid DNA encoding GCaMP5G or a GCaMP6 variant downstream of four non-repeating upstream activation sequences[69], and 40 ng/μL Tol2 transposase mRNA diluted in E3 medium with 0.025% phenol red. The traces show $\Delta F/F_0$ (mean ± s.e.m.) averaged over all stimulus directions. Larvae were mounted as in previous studies[17] and imaged at 6 d post-fertilization (dpf) using a custom-built two-photon microscope with a mode-locked Ti:Sapphire laser system (Spectra-Physics) tuned to 920 nm and a water immersion objective (XLUM Plan FLN 20X/1.0 W; Olympus). Images of the neuropil as well as somata of stratum periventriculare neurons were acquired at 5.85 Hz using software custom-written in LabView (National Instruments). Visual stimuli were presented on a flat opal glass screen underneath the larvae using a Microvision PicoP laser projector and a long pass filter (590 nm). A black bar of 1 mm thickness sweeping at 2 cm/s across a red 4.2 x 4.2 cm square centered on the fish was alternated in four cardinal directions. Each direction was presented three times. Each imaging plane consists of a neuropil region, containing processes from many neurons, and a region of mosaically labeled somata. Soma ROIs were selected manually by mouse-clicking on the centers, and the boundaries of the neuropil regions were also chosen by hand. Fluorescence traces were then automatically extracted, averaged over 3.15 μm radius circular regions of interest for the somata and 6.3 μm squares tiling the neuropil region with 3.15 μm steps, using Matlab (Mathworks) scripts. Baseline fluorescence (F_0) was defined as the median fluorescence in a 2 s period prior to the stimulus onset, minus the light level detected with the laser attenuated by a Pockels cell, and each response trace was converted to units of $\Delta F/F_0$. Because different cells will respond with varying latencies, in order to generate average response traces for comparison of kinetics, each individual trace was first aligned in time to be maximally correlated with the average. SNR was calculated by dividing the fluorescence change by the standard deviation of the point-to-point difference during the baseline period. Peak ΔF/F and SNR were the maximum single frame values recorded during stimulus presentation. Decay time was defined as the time taken for the average trace to fall to half its maximum value from the peak. All data points and error bars shown are the mean and s.e.m. values across different fish

Supplementary Table 2 | Biophysical properties of purified GCaMP sensors.

Selected GCaMP variants were cloned into a pRSET bacterial expression construct and transformed into *E. coli* for analysis as purified proteins[16]. T7 Express bacteria (NEB) were grown in 100 mL of ZYM-5052 autoinduction media[70] containing 100 µg/mL ampicillin at 30°C for 48 h. Bacterial pellets were resuspended in 10 mL of B-PER (ThermoScientific) and lysed with 1 mg/mL lysozyme and 15 U/mL DNase, and lysates were cleared by centrifugation. Supernatants were applied to 500 µL of Ni^{2+}-charged Profinity IMAC resin (Bio-Rad) in gravity columns. The resin was washed with 80 column volumes of 20 mM Tris, pH 8.0, 300 mM NaCl, 1 mM imidazole followed by 20 column volumes of 20 mM Tris, pH 8.0, 500 mM NaCl, 10 mM imidazole, and GCaMP variants were eluted in 750 µL of 20 mM Tris, pH 8, 100 mM NaCl, 100 mM imidazole.

Calcium titrations were done using EGTA-buffered Ca^{2+} solutions (Calcium Calibration Buffer Kit #1, Life Technologies). Purified GCaMP variants were diluted 1:50 in quadruplicate in 30 mM MOPS, pH 7.2, 100 mM KCl containing either 10 mM EGTA (zero free calcium) or 10 mM CaEGTA (~39 µM free calcium). These two stocks were mixed in various ratios to give 11 different free calcium concentrations. Green GCaMP fluorescence (excitation 485 nm, 5 nm bandpass; emission 510 nm, 5 nm bandpass) was measured using a Safire2 plate reader (Tecan). Dynamic range was determined from the 0 and 39 µM free Ca^{2+} points. Sigmoidal binding functions were fit to the calcium titration fluorescence data to extract the Hill coefficient and K_d for Ca^{2+} for each GCaMP variant. k_{off} was determined from a single exponential fit to the fluorescence decay following rapid mixing of the protein samples in 1 µM calcium with a solution of 10 mM BAPTA at room temperature, both buffered with 50 mM MOPS, 100 mM KCl at pH 7.2, using a stopped-flow device (Applied Photophysics) coupled to a fluorometer (Varian). pH titrations were carried out by diluting concentrated purified proteins into pH buffers containing 50 mM citrate, 50 mM Tris, 50 mM glycine, 100 mM NaCl, and either 5 mM $CaCl_2$ or 5 mM EGTA that were pre-adjusted to twelve different pH values between 4.5 and 10.5. pK_a values were determined from the inflection point of a sigmoid fit to fluorescence versus pH. To determine chromophore extinction coefficients (ε_{apo} and ε_{sat}), absorbance of purified GCaMP variants in 50 mM MOPS, 100 mM KCl, pH 7.2 with either 5 mM $CaCl_2$ or 10 mM EGTA was measured at 497 nm or 505 nm, respectively. Chromophore concentration was then quantitated by denaturing the protein sample in 0.1 M NaOH and using the extinction coefficient 44,000 $M^{-1}cm^{-1}$ at 447 nm for denatured GFP chromophore. Quantum yields (Φ_{sat}) of calcium-saturated GCaMP variants in 50mM MOPS, 100mM KCl, 5mM $CaCl_2$ were measured directly with an integrating-sphere spectrometer (Quantaurus-QY, Hamamatsu). Values are mean ± standard deviation for three independently purified protein samples. All variants have the same calcium-free and calcium-bound excitation/emission peaks of 505 nm/517 nm and 497 nm/515 nm, respectively. Size exclusion chromatography was also performed with 20 µM protein, and the GCaMP3, GCaMP5G, and GCaMP6 variants all were >95% monomeric with or without calcium.
